Ronsonol or naptha.

Goo Gone can work too, it is d-limonene mixed with naptha.

If I were looking for real pipe cleaners, I would go to a smoke shop.

Maybe hobby stores? Or craft stores?

The only thing I ever used pipe cleaners were for making things, so most of the ones I ever saw were in different colors. Those had to come from a hobby type store.

Of course, hobby stores are fading. There was a time when there were three decent size hobby stores in the downtown area, now they are much further flung. Craft stores seem to have made a bigger splash, some of the same territory but not all of it. This "MIcheal's" craft chain has moved in recently, that seems to be the trend.

   Michael

Not too long ago, I saw real pipe cleaners at a grocery -- Kroger, I think -- on a corner display of assorted gimcracks.

You can also get tiny bottle brushes in the toothpaste aisle.

Craft stores have the soft touchy feely pipe cleaners.  LOL  Pretty
much useless for cleaning anything.

My back is pretty sore from loading/unloading all the radios so I'm
not breaking any speed tecords for cleaning them.

Thanks

Dan

I have not checked grocery stores yet...and the small brushes sounds
good too.

Thanks

Dan

BTW, checked out your sewing page...A treasure trove of useful
instructions for someone like me, I have not sewn in 45/50 years.  Any
recommendations/tips on a used sewing machine to look for?

Dan

If it's painted black and still works, nothing will kill it. If it doesn't work, pick all the lint out of the innards, clean off the varnish that used to be lubricant, oil it, put in a new needle, and try again. (Check that it takes a standard needle.)

There were bad machines built in the black-paint era, but the few surviving badly-designed machines are in museums, so you aren't likely to get stuck with one.

Singer sewing machines peaked with the 400 series (beige, if I recall correctly), tanked for a while (the 600 drove me INSANE), and are said to be coming back.

Take samples of your favorite fabrics, and samples of fabrics that are hard to sew (sheer, heavy, slick, fuzzy, stretchy . . .), and try out the machines. Someone on Creative Machine recently commented that you should also bring your own thread. (When I worked in a Singer store, we demonstrated on heavily-starched sheer fabric that *nothing* could make a bad stitch on. We also used very cheap thread, because machines had not yet gotten picky about thread.)

I've been using the same machine since 1964, so I don't have a great deal of shopping experience. Buying at a shop that does repairs is a good idea.

A poster on the Creative Machine mailing list said that it's very important to her that her machine do a good keyhole buttonhole, which reminds me that I should have mentioned stitch variety.

Decide which stitches are vital and which are useful, and don't be snowed by advertisements touting vast numbers of stitches.   Which stitches matters; total number doesn't.   (Unless the total is smaller than your list of must-haves.)

I do most of my work on an old straight-stitch treadle machine I ransomed about ten years after I bought my electric machine, but when I carry a job into the room where the zig-zag machine is, I'm very glad that I've got it. I've forgotten how to make the Necchi do other stitches, but the book and stitch chart are very clear; it wouldn't take long to look up a fancy stitch if I wanted one.

Some folks are hipped on having a blind-hemming stitch, which sews a few stitches straight, then makes one zig to the left to catch the fold of the fabric. When I don't care enough to sew a hem by hand, I top-stitch it. It's easier and more secure than the blind stitch, and looks just as good. I might use my blind-hem stitch to make a shell hem some day. (For that, you adjust the zig to fall off the fabric entirely, which pulls the edge into a series of scallops.)

There are times when I wish that I had a three-step zig-zag: the machine makes three straight stitches angling to the left, then three angling to the right. The Necchi would do it if I put in the right cams, but as far as I know, they stopped making new cams for this machine before the three-step was invented.

If you have access to alt.sewing, it would probably be best to continue this discussion there. (On the other hand, there isn't much traffic on this channel, and this sub-thread is easy to skip.) (And saying "what do you want in your new machine?" might stir up more information than you wanted.)

I for one find this fascinating. I had an aunt who was a whiz with a sewing machine.

I think wax is often very hard to clean off because not much dissolves it, particularly petroleum wax. Naphtha, which is similar to white gasoline, may do it but I think other solvents may need to be used. I had some luck recently using disc brake cleaner. This is a mixture of solvents and comes in spray cans. You can get it at automotive supply stores. One must be careful because many solvents will attack paint. Certainly xylol (AKA xylene) and acetone will. You might even try kerosene or turpentine, both will dissolve certain waxes.

We're back to the original topic -- to wrench the thread back to sewing, when I bought the White Family Rotary treadle machine, my spouse used kerosene to clean out its guts. Kerosene was cheap and readily available at the time. But I don't know what kerosene would do to paint. The varnish that old lubricants turn into is a great deal like paint . . .

Even soap will wrinkle paint if it's concentrated and you let it set.

(But soap won't take paint out of a T-shirt, or even fade it.)

Kero won't touch most good paint, not even lacquer. It's more or less the
same general family as naptha. It's a good choice for removing varnish from
old lubrication if you can get a brush or pipe cleaner in there. It's not
as aggressive as xylene or mek, both of which will damage paint but get
lube varnish off faster.

After cleaning up old equipment without disassembling it, you may still have
hidden varnish in places. One way of dealing with this is to use a synthetic
ester oil.... these oils have good solvent action and are pretty good at
dissolving that gunk in hidden corners. Just keep running it through until
it stops coming out yellow.

If anyone uses MEK...Remember MEK goes right through the skin.  The
skin is porous to it.  It will pass right through the skin and that is
not good for you!!!

Dan

Subject: DX-100 or Apache?
From: Brian Burns <brianburns1066@gmail.com>
Injection-Date: Wed, 01 May 2013 17:54:24 +0000
Content-Type: text/plain; charset=ISO-8859-1
```

Hello All,

I'm looking for an AM/CW rig in the 100 watt class, and may have a choice between a Heath DX-100 and a Heath Apache. In looking at the specs I could find on the two, the Apache looks like the better choice. What do you think?

Cheers,

Brian Ex: W5BRO, K6UCD

Well, the Apache will send SSB, which is a good feature to have, whereas
the DX-100 won't. On the other hand, the DX-100 is much simpler, as a result.

But I would pick whichever of the two is factory-wired. If they were both
built as kits, I'd pick the one that has the best-looking solder joints.

    Good advice but if the rig is primarily for AM I would
check the manuals to see how its generated.  The DX-100 is
plate modulated but most SSB rigs do AM by either injecting
carrier on one sideband or with controlled carrier or some
other scheme that will work with a linear amplifier.

The B&W 5100B is better than both except it does not have 160.  B&W's
sound great on AM and work fine on CW too.

Hello All,

Thanks for all the quick replies and good advice! I should know in a few days about the availability of the rigs.

The B&W 5100 looks like a great rig, but I don't recall ever seeing one for sale. Were there only a few made? Or does everybody want to keep theirs?

Cheers,

Brian

I think it's a combination of few made and the owners don't want to get rid of them. They have great audio. I have had several and was always happy with performance. Also like the low pass filter that was built in. What price range are you looking at? My email addy is danl4NOster@gmail without the NO, if you would rather not say online.

Another possible choice is the Johnson Viking I and II. Both 100 watt
rigs that cover 160m but require an external VFO.

There are literally hundreds of different transmitters out there that will fit the bill, and to be honest a lot of them are much better made than the Heathkits which always seemed kind of marginal to me.

Everybody from Hallicrafters and Globe King on up to Collins made something like that.

I have to say, though, that the Vikings are really hard to beat. They are steady as a rock, the power supply is seriously overdesigned, and they are well-cooled. There are hundreds of small shortwave broadcasters in South America using the things with the key down 24 hours a day with no rest, and they just run and run. Audio quality is superb. You can add a modern synthesized VFO or the original Johnson VFO (which is pretty stable) or a crystal.

But it was a valid point to check.  Most SSB transmitters used low level
modulation for AM, so the Apache then becomes a relatively uncommon item,
an SSB rig that does plate modulation for AM.  That tends to make it a
better choice, since it does SSB too.

Let me guess: this approach gives you higher output power on AM since the
final can be operated class C, but it doubles the weight of the transmitter
with that huge modulation transformer?

The complaint about some of the Johnson transmitters is mainly from people who want hi-fi AM broadcast quality. Most of them have clippers built-in and filtering for the clipper and to tailor the frequency response for best intelligibility. This IMO is actually a plus. Without a clipper or some other form of amplitude limiting the average modulation level for speech must be quite low. One other problem evidently is that if too much clipping is used its hard on the modulation transformer. Valiants are reported to have this problem more than the 500. In any case it doesn't take much clipping to increase average modulation significantly without excessive distortion. Not too many AM rigs had clippers in them, Collins did in the 30K and KW-1 but not the 32A series.

Fwp-

I found a manual at <http://www.hammarlund.org/PDF/HQ-100.pdf>, but it does not specifically show the tube layout. However, it does provide V-numbers vs tube types. If the V-numbers are stamped on the chassis, then you can figure it out.

There are also manuals for other Hammarlund models at <http://www.hammarlund.org/PDF>.

It's been a while since the company name wsa mentioned here, I guess
another indicator of the fall of usenet.

But I could have sworn nobody ever mentioned "Radio Mart" in a good light,
it was always "that &$#)%)%# so and so, buying cheap and selling high".

Buying cheap and selling high is fine, that's what makes the economy work.

What is bad is buying cheap broken things and selling them at high prices
claiming that they are working when they are not.  Also bad is buying a
cheap variant of a model and then selling it as a more expensive variant
when it is not.  These practices are known as "fraud."  Another bad thing
is to accept money for an item and then never, ever ship it.

Your description of his practices are more like all the posts I
remember about him!  I was always surprised he never had anyone show
up at his door.  I have known hams that would visit "Problem" sellers
as representitives of hams that were ripped off.  With all the hoopla,
I sure hope this is accurate info on him.  It would be a shame if
someone else was selling from those stalls.

Where is this guy from anyway?

Dan

Can't guarantee it, but you can probably find the service manual, to include the tube layout, at mods.dk

They have almost everything.

The K9YA Telegraph is a FREE, monthly, general interest amateur radio
publication read by Hams in more than 100 countries. The K9YA Telegraph
contains the stories and features most wanted by our readers, because
it is written by them. An e-Zine, it is delivered monthly as a
full-color PDF file.

If you're in the mood for Morse, hankering for history, gluttonous for
gear, ravished for a review, needing nostalgia, or just plain famished
for fun, you'll find it in the K9YA Telegraph.

To check out sample issues, subscribe or write an article, visit the
K9YA Telegraph Web site.

I have started building a 7-MHz AM trasmitter with four suppressor-modulated 803s in push-pull-parallel. I expect to get nearly 400W of carrier power.

My only concern is plate voltage. As a matter of fact I plan to use a power supply that delivers about 2800V under no-load conditions, which is considerably higher than the maximum allowed plate voltage (2000 V) and I have no simple means to reduce it.

My intention would be to increase the negative grid bias, so as to reduce plate current and stay within the allowed plate dissipation.

Does any one have experience of operating an 803 (or an 813 which is very similar) at a much higher plate potential?

Thanks & 73.

Hello All,

Well it looks like the Viking II wins by default. Two have become available=
, for very reasonable prices, and they can cover the WARC bands as well as =
160m.

As for audio modifications to improve fidelity--which AM'ers seem to want t=
hese days--Electric Radio magazine has a series of 3 articles describing a =
couple of levels of modification. June, July, and August 1998, and they hav=
e been used to good effect by no less than one of our favorite highly criti=
cal curmudgeons, who shall remain nameless (;->)...

Electrical Radio back issues are available directly from the publisher post=
 haste, and for boatanchor lovers a subscription is just about mandatory!

Someone asked about my call sign. I was very active back in the early 1950'=
s as W5BRO in south Texas, and K6UCD in Redwood City, Calif.

Thanks very much for all the responses--much appreciated!

Cheers,

Brian Burns

Tony, go ahead, some time ago (more than i like to remember... hi !)
i've built a linear amplifier with 3x813, 2500 volt plate, all ok...

Watch the screen grid current, it is a very good indication for
pentodes.
Do not surpass G2 specified current.

If you wish, mail me directly to : piero.soldi(at)libero.it

73, Piero i5spo.

Originally England. Been here is the U.S. since 1999 or so. He had a Ham
radio retail shop in a small English city. He developed a reputation

there for shadiness, but still had a few regular customers who'd stop by. According to one of them, one day suddenly the store was shuttered and Martyn was gone. He's been here since, pulling his stunts.

The reason no one has 'paid him a visit' is because he apparently knows how to *really* b.s. people. On various website archives, you can find quotes from implying that he owns a bunch of guns, is best friends with Kentucky state troopers, things like that. As of this date no one's called his bluff on that.

He has an Amazon.com radio store now, but it also appears his account might've been suspended over complaints. It appears that way right now.

My HQ-145XC manual has the tube layout on the diagram of the radio.

Yes, I'm starting to remember now. Sounds like a blowhard to me.
Wonder how many of his marks will visit him in Dayton, if it really is
him. If I had been ripped off by him and was going to be in OH he
would be in for a surprise. Don't much care for crooks dealing ham
goods!

Let me warn you against doing this. Not because it will devalue the radio
(which it might, but if you keep the parts you or someone else can always
undo it). Not because it sounds bad, because it sounds pretty good.

If you have an unmodified Viking, it sounds like a Viking on the air, and
people will stop and say, "Hey, I can tell you're on a Viking, it sounds
great!" If you open it up, it will just sound like every other wideband
radio out there.

And yes, the wider bandwidth means poorer copy under marginal conditions and
adjacent channel interference under crowded conditions. Those may not
bother you because most folks aren't going to be running AM under either
of those extremes anyway.

But the Viking is just a great-sounding radio with a distinct sound and
it seems a shame to lose that.

The K9YA Telegraph is a FREE, monthly, general interest amateur radio publication read by Hams in more than 100 countries. The K9YA Telegraph contains the stories and features most wanted by our readers, because it is written by them. An e-Zine, it is delivered monthly as a full-color PDF file.

If you're in the mood for Morse, hankering for history, gluttonous for gear, ravished for a review, needing nostalgia, or just plain famished for fun, you'll find it in the K9YA Telegraph.

To check out sample issues, subscribe or write an article, visit the
K9YA Telegraph Web site.

http://www.k9ya.org

July 2013 (Volume 10, Issue 7) articles include:

The Way We Were By Philip Cala-Lazar, K9PL

Dear Hiram By Bob Cashdollar, NR8U

Cyclone 40 Kit

USS Lexington By Scott B. Laughlin, N7NET

"My Wife is Good for Something" By Duke Wahl, Jr., WA9WJB

"Night Flight" MIC By Philip Cala-Lazar

Ham Lingo By Dick Sylvan, W9CBT

I recently got a Drake TR 4 that seems to work fine....except the audio on the 10 meter band everyone sounds like there talking under water. I don't think it,s the BFO, because this is the only band I have trouble with. All the other bands sound great. Can anyone give me a clue as to what might be wrong?

Thanks...

The first thing I would try is to spray contact cleaner on the band switch contacts, and exercise the switch to clean it up.

Does it transmit OK on Ten Meters? If not, you may have a weak heterodyne oscillator crystal for that band.

Are you operating it in AM mode or SSB?

There is a Drake collectors group on the internet and also a group that
gets together on the HF that you can join.

Thanks guys for your suggestions on my TR-4.  I tried the contact
cleaner, I removed the crystals and re-seated them. So far no success.
So, I,m still looking for any ideas anyone might have.

I strongly advise joining the Drake list on Yahoo. There are some real experts there. You should also get the CD offered by Garrey Barrell www.k4oah.com
This has the correct handbooks and schematics for the several versions of the TR-4 plus a lot of date not in the factory manuals.

What you describe sounds like an unstable crystal but ask on the mailing list and see if you get other suggestions. If you need a new crystal they are available from International Crystal.

Now there's a real boatanchor....

So, does anyone have a re-tube kit available for this or do you have to
search the world (most tubes now being manufactured in the orient) buying
them individually?

All of the tubes in the R-390 are common military types which you can buy at a place like Antique Electronics Supply or Triode Electronics, except for the ballast tube which has become a rarity.

But, the tubes in that receiver should last a lifetime because they are not very stressed at all. I would not just go and swap out all the tubes for no apparent reason. Go ahead and test them, but don't expect to find anything out of tolerance other than the power tube on the audio deck.

The tubes are actually the least of your worry on that thing, and alignment is a nightmare. My inclination is to just send it off to Chuck Rippel who specializes in those things and let him deal with it. He does beautiful work.

>(Who spent many nights listening to WABC from Germany in an AN/GRC-26D)

The audio quality on that fake BC-342 is a whole lot better than the R-390 will ever be, although I can recommend the Electric Radio retrofit audio deck for the R-390 which definitely cleans things up a lot. Still, the tight skirts on the mechanical filters are not conducive to a pleasant listening experience on MW.

Looking for the schematic for my fathers Drake SW2 shortwave receiver that needs repairs. The schematic is not in the operators manual and Drake states that they no longer support the radio. Some copies of the schematic were sold by Drake which stopped sometime in 2012 because they were bought out, downsized, moved and many workers were let go. If anyone that was lucky enough to get a copy of the schematic please contact me. A copy, a photo or a scan would be great. Any help would be appreciated.

I am pretty sure there is a full manual with schematics in BAMA. I recently
was given an SB-2 with sensitivity issues and saw the SW-2 manual while
looking for the SB-2 one in BAMA.

The SW2 should not be too hard to work on; it is a big step up from an AA5
but there isn't anything too weird about it.

The K9YA Telegraph is a FREE, monthly, general interest amateur radio publication read by Hams in more than 100 countries. The K9YA Telegraph contains the stories and features most wanted by our readers, because it is written by them. An e-Zine, it is delivered monthly as a full-color PDF file.

If you're in the mood for Morse, hankering for history, gluttonous for gear, ravished for a review, needing nostalgia, or just plain famished for fun, you'll find it in the K9YA Telegraph.

To check out sample issues, subscribe or write an article, visit the K9YA Telegraph Web site.

http://www.k9ya.org

February 2013 (Volume 10, Issue 2) articles include:

HI-PER-MITE: Audio Filter Kit by NM�S & 4SQRP By Philip Cala-Lazar, K9PL

A Work in Progress - Part II By Paul W. Ross, W3FIS

Ms. Lilian Ruocco, W2PMA, Bronx, N.Y. By Bob Ballantine, W8SU

Conan Wyatt Burtram Barger, W3CVE - Part VIII By Scott B. Laughlin, N7NET

Now there's a real boatanchor....

So, does anyone have a re-tube kit available for this or do you have to
search the world (most tubes now being manufactured in the orient) buying
them individually?

bill - KB3YV
(Who spent many nights listening to WABC from Germany in an AN/GRC-26D)

I have an NCX-5 that needs the cabinet repainted.

Does anyone know of a commercially available paint in a spray can that
is close to the corerect blue?

Thanks,

Craig

Keith, You can find the 1N3996A Zener Diode at RF Parts.
http://www.rfparts.com/catalogsearch/result/?q=1N3996A

Good Luck and 73's,

Marshall N6RTR

I smoked the "Line Adjust" rheostat in my TV-7D tube tester recently and
so far have not found a replacement.  I've got it by-passed now and am
using a variac to set the voltage level.
If anyone has a tv-7 junker, I sure could use one.  It is 200 ohms in
value and 1 1/2 inches in diameter.
Please reply at my email address on QRZ.com.

Thanks
Larry W4LK

Keith isn't here anymore.  It's been 16 years, had you looked at the date,
and virtually nobody around back then is still here.  Besides, most people
posting for something were drive by posters, coming for one specific thing
and never seen again.

Either he's solved the problem long ago, or given up on it.

There were a couple of answers back then.  At least one of them should
have been of help.

Just because google allows replies to messages older than 30 days (it's a
bug, they still haven't fixed it) doesn't mean anyone should be responding
to old messages.  Indeed, people are not using common sense.  They are
looking for something, yet don't realize how old the message is?

Oh BFD Michael,

He was just trying to help out a fellow human being.   He is obviously not a bigtime USENET expert such as yourself. Why do you want to squash him for good intentions and and being a Google Groups user?   Sheesh.

Here is a speillink error you can criticize me about.

Tomas

You want an Ohmite RHS250 rheostat. 250 ohms, 25 watt.

Galco has them in stock for $30 or so:
http://www.galco.com/buy/Ohmite/RHS250

Or you can take your chances with Newark or Allied and possibly get a much
better deal depending on how well you know your Newark or Allied rep.

Here is a speillink error you can criticize me about.

Tomas

And I could criticize all those who do not know that a high-power zener can be easily assembled putting together a plain power transistor and a very common low-power zener diode.

Looking for a high-power Zener is a waste of time and money.

The K9YA Telegraph is a FREE, monthly, general interest amateur radio publication read by Hams in more than 100 countries. The K9YA Telegraph contains the stories and features most wanted by our readers, because it is written by them. An e-Zine, it is delivered monthly as a full-color PDF file.

If you're in the mood for Morse, hankering for history, gluttonous for gear, ravished for a review, needing nostalgia, or just plain famished for fun, you'll find it in the K9YA Telegraph.

To check out sample issues, subscribe or write an article, visit the K9YA Telegraph Web site.

http://www.k9ya.org

March 2013 (Volume 10, Issue 3) articles include:

IGY - Part I By Philip Cala-Lazar, K9PL

A Work in Progress - Part III By Paul W. Ross, W3FIS

Conan Wyatt Burtram Barger, W3CVE - Part IX By Scott B. Laughlin, N7NET

Noise Level Normally Runs S7 Here, OM By John Kirk, VK4TJ

Ham Lingo By Dick Sylvan, W9CBT

Subscribe now so you won't miss the next issue.

Well Steve that's not going to happen since you've replied to a message from 1998 and even if Dwight stuck around the newsgroup for a bit, it's pretty much certain he's long gone.

If you want a speaker, find an actual buy and sell newsgroup and post there.

Replying to a 15 year old post won't help you one bit.

And if you're looking for someone selling such a speaker, then look for more recent ads, which means looking elsewhere, not the newsgroups. There's a newfangled thing called "ebay" that apparently is getting some attention. And at this point, there are likely web based "buy and sell forums".

Is there one? What is there to upgrade? The supplies in those things
is stiff and oversized, and everything is overrated.

There's stuff that you might want to replace as they get old, like those
electrolytics, but it's hard to imagine upgrading. Sometimes those
rectifiers fail, but hardly ever. It's a nice design.

I remember having seen an "upgrade kit" on sale, in which the voltage doubler was substituted by a voltage tripler. With 572Bs in place of 811s. It would probably give a kW out instead of 650W, but the power transformer would certainly suffer.

That sounds horrible! The wonderful thing about those amps is that there
are enormous safety margins on everything and they are just solidly
over-engineered. Why would anyone want to wreck that for the sake of
less than one S-unit?

The K9YA Telegraph is a FREE, monthly, general interest amateur radio publication read by Hams in more than 100 countries. The K9YA Telegraph contains the stories and features most wanted by our readers, because it is written by them. An e-Zine, it is delivered monthly as a full-color PDF file.

If you're in the mood for Morse, hankering for history, gluttonous for gear, ravished for a review, needing nostalgia, or just plain famished for fun, you'll find it in the K9YA Telegraph.

To check out sample issues, subscribe or write an article, visit the K9YA Telegraph Web site.

http://www.k9ya.org

April 2013 (Volume 10, Issue 4) articles include:

IGY - Part II By Philip Cala-Lazar, K9PL

The Chinese Invasion Continues By Paul W. Ross, W3FIS

The Art and Skill of Radio-Telegraphy - Fifth Revised Edition

Conan Wyatt Burtram Barger, W3CVE - Part X By Scott B. Laughlin, N7NET

Bob Henry, W0ARA By Bob Ballantine, W8SU

Ham Quips By Dick Sylvan, W9CBT

Subscribe now so you won't miss the next issue.

I have a Capehart R-390A and a RBC-5. I have not fired up either in
about 15 years but have kept them in AC storage. I intend to work up
the RBC-5 and would like to have some info on what to do before
start-up. Any help would be appreciated. Thanks.

Subject: Putting a date on waxed or painted electrical wiring
From: tumbleweed.town@gmail.com
Injection-Date: Sun, 17 Mar 2013 00:27:56 +0000
Content-Type: text/plain; charset=ISO-8859-1
Content-Transfer-Encoding: quoted-printable

I'm attempting to determine the approximate age of a device I have by it's =
wiring since there are no other identifiable marks. While it's not actually=
 a rig (it's an old electric powered film security camera), I feel this is =
the appropriate place to post given the expertise of the Ham community.=20

At first I believed the outer coating of the wire is a waxed cotton or pape=
r but upon closer inspection may actually be white paint or some early form=
 of wire plasticization. This waxed or painted part is braided around a rub=
ber wire and the rubber is translucent white in color. The wire is 14 gauge=
, stranded steel, one conductor.

```
My intuition says this is a plane or tank camera from WWII, or possibly a b=
ank security camera but since it has no markings I cannot look it up. I hav=
e also not found anything even remotely similar in likeness anywhere on the=
 Internet. Any insight to an age range of when this wire was used commercia=
lly would be greatly appreciated.

What is the camera?  Any nameplate?  Does it take 35mm or 16mm?  Perfed or
unperfed?  Does it shoot a single frame or cine?  What does the lens mount
look like?

>At first I believed the outer coating of the wire is a waxed cotton or pape=

Anything that is stranded steel is pretty weird to begin with, and would be
```

used only for special purposes. Are you sure this is an electrical wire and not used for a mechanical purpose?

>My intuition says this is a plane or tank camera from WWII, or possibly a b=
>ank security camera but since it has no markings I cannot look it up. I hav=

If it's a bank security camera it probably took unperfed film with a mutilated roller to advance frames. The film was processed with the same microfilm processing gear the bank used for check microfilms.

If it's a gunsight camera from WWII, it will be a cine camera and it will (if it's American) accept a 16mm daylight-loading magazine. The Army standardized on those early in the war and there are a _lot_ of old AN/N-6A gunsight cameras out there.

Another common possibility is a radarscope camera. Those were single frame and not cine, but they would often accept daylight-loading magazines of various sorts.

Got any photos of this item?

That sounds horrible! The wonderful thing about those amps is that there
are enormous safety margins on everything and they are just solidly
over-engineered. Why would anyone want to wreck that for the sake of
less than one S-unit?
--scott

Scott,

the Collins 30L-1 has safety margins on everything but the final tubes, which can get easily damaged when the amplifier is tuned up by an unexperienced operator. It is a common experience to open a 30L-1 and see holes in the tubes plate. The 811s do not at all forgive operator mistakes.

Moreover, with only 260W available total dissipation, one must be very careful also during normal operation, especially on CW. In my opinion using the carbon-plate 572B in place of 811s is a must. Same output power, but with 640W total dissipation.

Coming back to the "upgrade kits", I hate modifying any vintage equipment. My philosophy is that, if I need something better or more powerful, I get something else rather than modifying what I have.

Although I would never substitute the doubler with a tripler in my 30L-1 power supply, I must admit that it may not be a bad solution provided that:

- the 811s are replaced by 572Bs
- the amplifier is never pushed to a higher output power than before the modification (that is about 650W), so that the power transformer and the RF circuitry do not get stressed.

With the higher voltage produced by the tripler, a lower plate current would result for a given output power, with advantages in terms of driving power and linearity.

73

I believe the upgrade you are talking about is the replacement of the Caps and Diodes on the multiplier board. Just replacing with better caps and diodes. With a little searching on that bay site, I'm sure you can find a source.
Tom

That sounds familiar. For a long time, there were ads in QST, at least, from some company selling "rectifier stacks" to replace vacuum tube rectifiers. I guess they potted the diodes, they were a bit fancier than just a board with semiconductor diodes.

Michael

Guys, I'm looking for a cross needle SWR meter useable on the HF amateur bands.
I'm working on installing an HF mobile in my car.

If you have one for sale or know of one available please let me know.

Thanks for any help you can provide.

Yup; it's either a HW-29 or HW-29A - heavily modified. The Heathkit logo was where the S-meter is now. Case has been repainted.

The plain 29 has four tubes, the 29A has five.

The schematic is available from www (dot) radiomuseum (dot) org, but I don't know if they have the manual (maybe try Bama).

Lots of folk modified those things. Somewhere you should find documentation for all the mods, but I can't help with that.

I suspect there were so many that they wouldn't be all in one place, even in this internet age. There also seemed to be multiple articles that detailed the same idea, with variation.

There were endless mods, simple ones like adding a tuning meter. There was one that converted the superregen receiver to a simple converter, which then fed an external receiver. I'm sure there was a mod to put one on 220MHz, though I have no idea which model it started with. There were all kinds of schemes to improve the superregen receiver. I can almost picture one that turned the receiver into a simple superhet right there in the box, but I may be imagining things.

Of course, one difference between the 29 and the 29A is that one of them uses overtone crystals, the other had an oscillator that ran at some lower frequency, multiplying up.

Can't anyone use common sense?

The post you are replying to is from March 2009, four years ago. Not only is it very likely he no longer has it, either sold or tossed into the garbage, but chances are very slim that he's still reading the newsgroup.

Since he was trying to sell something, he probably never lasted longer than that ad, indeed he probably never stuck around to see if anyone replied, he saw the newsgroup as a buy and sell newsgroup (it isn't) so there was no reason to wait around.

So you've resurrected an old thread, and can't even be bothered to quote what you are replying to. Except too many idiots are replying to old messages (so it's fairly obvious to some of us) it looks like you are talking to yourself, since the original message is long gone. Google isn't usenet, and just because they still have that bug allowing for replies to messages older than 30 days doesn't mean you should reply.

Don't reply to old messages. Even if you did, don't leave out the quoting.

If you want something, then post about it, don't resurrect an old thread. Post about how you'd like to buy one of these.

Keep in mind that the late seventies is hardly a "boatanchor". It hasn't got tubes (except maybe in the final), it's not really heavy, it's not really old.

FInally, since you aren't providing traffic here to lure people so they stick around to read your ad, don't bother posting here. FInd the places with the high traffic, specifically the high traffic buy and sell places, and post there. Because most people were never here in the first place, they only came to sell their junk (including all the off-topic junk), and virtually everyone else has left, leaving very few people who might actually have what you are asking for in your off topic ad.

How do you know this?  I searched the header and didn't find 2009
anywhere.  Other than just the tone of the message, how can we tell when
someone is responding to an old message?

Thanks,

I am cleaning an assortment of transmitters and receivers. Most have wax residue in ventilation holes. I have tried using several cleaners and soaps with a soft tooth brush and hot water. I can't find my old style stiff pipe cleaners, only the new soft designer color ones. I am going to try and find a store that stocks the old style ones.

Any suggestions on methods or products that will remove the wax without damaging the paint???

I have done 1 and have 7 more to do, so easy is best!!!

Thanks

Dan N9JBF

The solid state replacement doesn't use filament power, so the load on the
transformer is less.

Yes, and will result in 15 Watts less heat in the cabinet
with the 5U4 gone. Stability will be improved
and warm-up time reduced. Just don't forget
to add the 200 Ohm resistor to bring the B+ back to normal.

73,

What's in it? Is it just a pair of 1N4007s, or does it also have a power resistor?

If you replace a tube rectifier with a pair of solid state ones, your B+ voltage will rise. How much? Depends on the load and the original rectifier type. Measure the B+ with an analogue meter (not a modern high-Z meter) and compare with the schematic. If the numbers are no more than 10 or 20

volts higher, I wouldn't worry about it. If they have shot way up, I would add some resistance in there.

The K9YA Telegraph is a FREE, monthly, general interest amateur radio publication read by Hams in more than 100 countries. The K9YA Telegraph contains the stories and features most wanted by our readers, because it is written by them. An e-Zine, it is delivered monthly as a full-color PDF file.

If you're in the mood for Morse, hankering for history, gluttonous for gear, ravished for a review, needing nostalgia, or just plain famished for fun, you'll find it in the K9YA Telegraph.

To check out sample issues, subscribe or write an article, visit the K9YA Telegraph Web site.

hello ,having finished my adventures with th nm52a that works well now:I receive uhf trafic from aircrafts,also lots of stations around 430 mhz,and of course the portable telephones around 960mhz,now I go mugh lower in frequencies,really longwaves with an arn6 that was sitting
(and sleeping)unused in my garage since 20 years....
I have started to make it work,the result of the first day is that it works.I have found how to power it,I use a strong 24v dc supply already used for others surplus receivers.It works it seems on the 200khz-400khz band,I get several cw stations ,I have found how to use the antenna input,where to connect the loudspeaker (I use a ls3).But I was unable to change the frequency band ,and to make the bfo work.I have found the complete manual,but the scanning is very poor,and difficult to read,zooming does not

make things better...so please all I need are details of the connector at
the rear of the set labeled A to Z,with signal descriptions and
a few details how to use them mainly how to change the received band ,and
the bfo.I will not use it on a plane,and usually most of the time I think I
know how to go home :-)))but it is a nice receiver,and it can be used after
converters.
Thanks and 73 F1gqb

The back panel of my Gonset G-77 transmitter bears a circular 4-pin black
plastic female connector, say half an inch in diameter.

The schematic diagram identifies it as an "Amphenol 71-43" (not sure, my
manual photocopy is not very good).

A few questions:

- is it really a 71-43?
- does the mating plug bear the same identifier as the socket?
- does any one know where I could find the mating plug?

Thanks & 73

Tony I0JX

Looking at the 1972 Amphenol catalogue, I am thinking it's a 71-4S

>- does the mating plug bear the same identifier as the socket?

The plug would be a 71-4P.

>- does any one know where I could find the mating plug?

Amphenol sold that line to WPI which sold it to Cooper Interconnect.

I think the 71 series connectors are gone, but I am pretty sure that some of the 91 series connectors will interoperate with them. You could try this one:

http://www.newark.com/cooper-interconnect/91-mpm4s/connector-din-audio-plug-4way/dp/39F3003

No, it's not a DIN standard plug, no matter what the Newark site says.

--scott

Thanks for info. However Newark does not have them in stock, and anyway I would have to buy a minimum of 25 pieces, for a total of about $700

Searching the web for 91-type connectors I found something on SSN

Would you expect that connector marked (CNA) 91-M4S on http://www.surplussales.com/Connectors/Microphone-6.html would mate?

The SSN identifier looks quite close to the Newark one (91-MPM4S)

SSN seems not to require a minimum order value. But I am not sure whether they would ship internationally for a $2.5 item.

Will try.

I am looking for the schematic diagram of the Gonset power supply / modulator nod. 3117 (DC only) for the G-77 transmitter.

Note: I already downloaded from BAMA the diagram of power supply / modulator mod. 3201 (DC + AC), but the 3117 is somewhat different.

Would any one having it be willing to make a scan for me?

Thanks & 73

Tony I0JX

Tony-

For specs, go to <http://www.rigpix.com/gonset/g77.htm>. At the bottom
of the page you can click on "User manual", which takes you to
<http://www.rigpix.com/gonset/g77_manual.pdf>.

There is no mention of the 3201, only the 3117. The manual has the
diagram, but it is split with no overlap.

Tony-

For specs, go to <http://www.rigpix.com/gonset/g77.htm>. At the bottom of the page you can click on "User manual", which takes you to <http://www.rigpix.com/gonset/g77_manual.pdf>.

There is no mention of the 3201, only the 3117. The manual has the diagram, but it is split with no overlap.

Fred
K4DII

Hi Fred,

the file on rigpix is actually the same file I had downloaded from BAMA. But I had not realized that it also contains the model 3117 diagram.

So, thank you for pinpointing that.

Yes, a little piece of the diagram is missing, but no practical problem.

BTW I have determined that:

- power supply / modulator model 3117 (DC only with vibrator) was standard for transmitter G-77
- power supply / modulator model 3201 (DC or 115VAC) was standard for transmitter G-77A

I believe that model 3117 cannot be readily converted to AC operation (e.g. by removing the vibrator and feeding 6VAC o 12VAC into its socket), as the transformer is sized for the vibrator frequency, that is about 120 Hz. At 50 or 60 Hz the transformer would presumably draw too high a current under no load conditions.

That one will definitely mate with the 91-series connectors like I suggested... but I am not POSITIVE that the 91 and 71 will mate.

Tony-

It might be worth a try with 6 or 12 VAC. I'd go for 12.6 VAC with a 10 Amp fuse to start with for protection.

According to the manual, it draws 9 Amperes at 13.5 VDC when transmitting. That should be within the capacity of many modern DC power supplies designed for a 100 Watt HF rig. Getting a good vibrator might be a problem!

Take the output of your 6V transformer... put it into a bridge rectifier
and then a series electrolytic.... Voila! Very ugly 120 Hz waveform.
You can clean it up a little with a tuned 120 Hz tank circuit but you may not
even need that.

Antique Electronics Supply in Arizona sells solid state retrofit modules
to replace vibrators.

Take the output of your 6V transformer... put it into a bridge rectifier
and then a series electrolytic.... Voila! Very ugly 120 Hz waveform.

Yes, I could try that way. If the rectified waveform contains harmonics of
100 Hz (not 120 in my case) it should not be a problem; on the other hand
also the the vibrator offers the transformer a waveform rich of harmonics.

Anyway I guess I would have to adjust the AC voltage so as to get the
specified DC output (about 515V). It will probably be somewhat higher than
just 6V.

It's a message fron 11 months ago, whether or not it's available, the guy
is hardly likely to still be here.  After all, it's an ad, and ads are by
their very nature hit and run.  He came here to sell something, not
realizing there isn't much of a readership here to see the ads, but
thinking he'd take advantage of the "content" to put his ad here.  I don't
recognize the name, so likely he only posted for his ad.  And when he got
nothing he left, since he saw no point to this newsgroup than to sell his
junk.

Of course, you could have tried to email him directly, though I still
can't figure out why you are responding to an old ad.  Yes, it's because
of google, but that doesn't explain why people are looking at old posts.
Yes, I can see someone searching for some bit of information, but I can't
see someone searching for an old ad.  Which then leaves a bunch of people
who just go through the archive looking at messages?  I can't believe
that.

    Michael  VE2BVW

The K9YA Telegraph is a FREE, monthly, general interest amateur radio publication read by Hams in more than 100 countries. The K9YA Telegraph contains the stories and features most wanted by our readers, because it is written by them. An e-Zine, it is delivered monthly as a full-color PDF file.

If you're in the mood for Morse, hankering for history, gluttonous for gear, ravished for a review, needing nostalgia, or just plain famished for fun, you'll find it in the K9YA Telegraph.

To check out sample issues, subscribe or write an article, visit the K9YA Telegraph Web site.

Does any one know which are the differences between the SX-122 and SX-122A.

A difference probably is that the SX-122 goes on 117VAC only (no 230VAC).
Others?

Thanks 73

Here is a very rare antenna mount for the pre WW2 SCR-178
Signal Corp portable radio.
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=271039137579#ht_500wt_1146

Included with the photos are2 line drawings showing the SCR-178 with the IN-85

antenna mount and a close up of the drawing.
I'm sure this item is NOS (New Old Stock) it has never been used, it is in as NEW condition. The only marks on it are wear from being in various boxes for the last 75+ years.

The last one of these I saw sale on ebay went for over $300 and it was ROUGH, no finish on it at all, missing it's wires and other hardware.

The SCR-178 is a scarce radio and the IN-85 antenna mount is almost beyond RARE, virtually unobtainium.

It will be well packed so no damage will happen during shipment.

NO INTERNATIONAL SALES. CONUS ONLY.

Can someone tell me if the crystals for an SPR-4 are compatible with the
SW-4A? I thought maybe the same crystals were used in the 4-line, SPR-4
and SW-4A, but of course I could be wrong.

Maybe, but I don't know. Drake used various schemes among their equipment. Some, the receivers, relied on low frequency filters to provide ultimate selectivity, while the transmitters obviously just used filters in the 5MHz range. I thought sometimes there was some variation on the HF filter frequency, and if so that would impact on the crystal frequency. Counter to that, if they did that, then you couldn't transceive with a T4 and an SPR-4.

Look for specs, see if you can find a page that has their IF frequencies. Or maybe the manuals are online.

Wait, a simple search on "receiver IF frequencies" gets this page very early on:
   http://www.agder.net/la8ak/e13.htm
and it says the R4 and the SPR-4 has a 5645kHz IF. No mention of the SW-4, but the 2a/b/c uses a tuneable first if, then 455KHz and 50KHz.

It's the Drake transceivers that use 9MHz IF, the TR4 going to 2 filters, one for USB and one for LSB.

The manual for the SW-4 is certainly online, I didn't bother downloading. Some more searching doesn't find the IF frequency, though I didn't try that much harder. One article does say it was a "modification" of the R4, so chances are good it used the same 5645kHz IF, but I wouldn't try without verification.

If the IF is consistent, then the crystal frequencies are likely the same.
I can't imagine them using different crystal oscillators that would
require different stock in crystals if the IFs were the same.

The manuals would certainly tell you how to have crystals ground for the
receivers, since they tended to have

Thanks Michael. According to the SW-4A manual, the 1st IF is 5645 and the 2nd IF is 455. Given that the first IF is the same as the R-4, R-4A, R-4B and the SPR-4, but the 2nd IF is different, how does that impact compatibility?

ICM should still be able to cut replacements for the 4-line if you need
them.

Thanks Scott. They are one of the sources I have looked at.

Content-Type: text/plain; charset=ISO-8859-1
```

I attended the 2012 Shelby Hamfest Friday and Saturday, Friday to shop and
see old friends and Saturday mostly to sell and do some more shopping,
IT WAS GREAT, I was dead tired when I got home. I'm typing
this at about 04:30 AM, I've been asleep since I got home except
for a short wake up to eat a sandwich for dinner, then back to sleep...

I brought home so much stuff I don't even remember it all. I think I
got 3 antique radios, one of them is going to be a fantastic project.
A Atwater Kent model R horn to replace the one in my collection with
bad pot metal. I also got a dual band 2 meter and 70Cm mobile for my
car, a bunch of parts and other stuff, AND I cam home with a little
more money than I went there with. THAT'S THE WAY TO DO IT.

I'll take some photos of the new stuff as I unpack later this afternoon.

ANOTHER GREAT SHELBY HAMFEST.

I have one of these in unmodified condition.

Before I wreck it (WWII Gee Navigation RF Unit) for the
tuning condensers and slow-motion drive, is it of value
as a radio antique?

If it is, and you want it, what would you offer in exchange?

Like much of the highly-prized equipment which was on sale in the 50s
and 60s, it is (as it is) essentially useless in the modern world. It
it's complete and in good condition, it would certainly be of interest
as a 'collectible'.  While it would seem be a shame to break up a piece
of history, some of the 'bits' - if recycled - are just as functional
today as they ever were, and would be of use to an old-fashioned
experimenter. It's certainly a difficult decision what to do with such
things.

You could list it on:

http://www.vintage-radio.net/forum/

If not already done so. A number of the guys there delight in getting
WW2 stuff together.

Les.

Especially as the existing hardare of tuning dial, 3 gang condenser and
supporting hardwar could form the basis of a single-band RX, all
using the same box / cabinet it came in.

Anyone in the group have a MilSurplus T-368/URT from which they could get me some dimensions? I am looking to build a underframe for my T-3 and I need some dimensions. The frame appears to be made from channel steel (the shape of a U with a wide base) and I need the width, height, and wall thickness of the steel. Also the general overall dimensions of the frame. I see that it is about the same length as the T-3 is wide but the legs extend out from the front/back a few inches. Also, how many shock absorbers are used?

73 & Tnx
Ron K3PID

The K9YA Telegraph is a FREE, monthly, general interest amateur radio publication read by Hams in more than 100 countries. The K9YA Telegraph contains the stories and features most wanted by our readers, because it is written by them. An e-Zine, it is delivered monthly as a full-color PDF file.

If you're in the mood for Morse, hankering for history, gluttonous for gear, ravished for a review, needing nostalgia, or just plain famished for fun, you'll find it in the K9YA Telegraph.

To check out sample issues, subscribe or write an article, visit the K9YA Telegraph Web site.

Ex-ship radio operator friend is looking for a Marconi Atalanta 2207C.
Working or not - he can repair and service.

I have looked all over the web without success. All ideas appreciated.

Sandy Young.

FWIW, stick it in ebay search notifications and wait to see if one shows
up. Its Atlanta, btw, not Atalanta. That will help the search.

Does any one have experience on using 6DQ5s in place of 8236s in the Hallicrafters SR-500? Not easy to find 8236s new.

Tubes are electrically identical, but the 8236 has a carbon plate.

Perhaps not pushing the transmitter to maximum power and cooling the 6DQ5 with a fan could be OK.

Another possibility would be to replace the 8236s with larger sweep tubes, such as 6KD6, 6JE6 or 6LQ6. But apart from changing sockets, I should check whether the bias and screeen voltages are compatible.

Again, any hands-on experience on that?

I can't imagine the carbon plate would make a huge difference in ham
radio service where people will often transmit for a minute or two at a
time. It might help somewhat, but it would not be the huge improvement
in power handling that you would get in pulsed service.

I would consider the EL509, since it's currently manufactured and pretty
reliable. Maximum ratings including the power dissipation are all MUCH
higher. Socket will have to be changed, or you can make an adaptor, but
it's a far more advanced tube design.

Bill and Geoff,

Thanks, I'll try that and see what happens. But if you hear of one I'd
be pleased to be advised.

Kind regards,

Sandy.

I can't imagine the carbon plate would make a huge difference in ham radio service where people will often transmit for a minute or two at a time. It might help somewhat, but it would not be the huge improvement in power handling that you would get in pulsed service.

That's OK. Nevertheless, in the 8236 data sheet, Tung Sol claims "Its carbon anode and hard glass bulb permit continuous operation at 50W plate dissipation". Conversely the 6DQ5 (electrically identical to the 8236) has a 24W plate dissipation. Actually, in the SR-500 the two 8236s draw 500mA at 750V, whilst in the SR-160 (identical to SR-500 except for output power) the two 6DQ5s draw 200mA at 575V

I would consider the EL509, since it's currently manufactured and pretty reliable. Maximum ratings including the power dissipation are all MUCH higher. Socket will have to be changed, or you can make an adaptor, but it's a far more advanced tube design.

Yes, the EL509 would be the most appropriate substitute. Its plate dissipation it 35W but, looking at it, it is hard to figure out why it has a lower plate dissipation than the 8236.

73

Hi,

Anyone have a Swan 1040V 75 meter add on kit?

Also a 20 meter coil.

73

Alan

The K9YA Telegraph is a FREE, monthly, general interest amateur radio publication read by Hams in more than 100 countries. The K9YA Telegraph contains the stories and features most wanted by our readers, because it is written by them. An e-Zine, it is delivered monthly as a full-color PDF file.

If you're in the mood for Morse, hankering for history, gluttonous for gear, ravished for a review, needing nostalgia, or just plain famished for fun, you'll find it in the K9YA Telegraph.

To check out sample issues, subscribe or write an article, visit the K9YA Telegraph Web site.

I would very much appreciate your help. The unit has been recapped and
the resistors shot gunned, most of the postage stamp caps or still in
the cans and drum. At this point it looks like the wring may not be
reconnected as it should be. I am checking voltage and resistants now (
not good). I have no sound from any band with ant. connected (nothing).I
can put 400cps modulated at 455 signal at the imput and can trace the
signal through the unit. I have every book I can find on the SP600 and
the JX-17.
I could very much use voltage for the following, T-8 pins left to right
and 1 at the top, E13-1 through 10, E14- 1 through 8, E15- 1 through 8,
E 16- 1 through 8, E 17 1 through 15.
This is a learning process for me, so some of the questions will show
how wet behind the 70+ ears I am.
Thank you for reading
Jimmy K5CSU

Do you have the military manual TO 11-851? There is a
high resolution version on the web. It shows the chassis

layout of most of the versions of the SP-600 and gives transformer voltages. You should be able to find the numbers on the schematic and the bottom of the transformer should have the corresponding numbers on the transformer terminal board. Pages 105 and 106 show voltages and resistances at the terminal boards.

Go over your recapping to see if you have mis-wired something.

Note that socket voltages except for grids are given as measured with a 1000 ohm/volt meter, more modern 20,000 ohm/volt meters will read high. Grid voltages are measured using a VTVM. With the correct meter the chart voltages are close to what you should get.

The BB caps should always be replaced but the postage stamp caps are silver mica types and seldom fail, although they can. They should not be shotgunned and those on the LO modules of the turret are precision values.

Before anything else make sure you have not accidentally left the REC-Standby switch in Standby. Also make sure there is a shorting wire across the diode load terminals at the back. Also make sure the crystal selector is in VFO although you should hear some noise even it its in one of the crystal positions. Clean the decks of the selectivity switch, it can cause the receiver to appear dead when dirty.

For trouble shooting first check the power supply voltages as given by the tube socket chart. This will start you and may find the problem. Check to make sure the tubes are in the right sockets.

First, check the power supply voltages as given by the tube socket chart.

Check to see if the receiver is dead on all bands or only on the double conversion bands (upper three).

If its dead on all bands use a second receiver (a broadcast receiver will do) to listen for the local oscillator.

Did you remove the RF deck to replace the caps there? If so did you remember to set the turret to half-way between two bands before re-installing it? If not you may have bent up the contacts on the deck. These are not supposed to be repairable but I have managed to make bent and broken ones work again with very careful straightening and soldering.

If you can inject a 455 khz signal and hear it the problem would appear to be in the RF section. I would start with the LO, then first mixer, then the two RF amps. Run the set on a single conversion band to simplify things.

If this is a JX-17 make sure the red knobs are not in external.

Some sets have transformers with square bottom terminal boards and some have round ones. The military manual covers both.

The power Transformer hsd the ac voltages stamped on it.  Have you
checked all the tubes and make sure the knob is in VFO.

The K9YA Telegraph is a FREE, monthly, general interest amateur radio

publication read by Hams in more than 100 countries. The K9YA Telegraph contains the stories and features most wanted by our readers, because it is written by them. An e-Zine, it is delivered monthly as a full-color PDF file.

If you're in the mood for Morse, hankering for history, gluttonous for gear, ravished for a review, needing nostalgia, or just plain famished for fun, you'll find it in the K9YA Telegraph.

To check out sample issues, subscribe or write an article, visit the K9YA Telegraph Web site.

While replacing two exhausted 6JE6A tubes in an SSB transmitter with a pair of identical tubes, I noted that, despite the new tubes are NIB, their idling currents are significanly different from each other. To be fully sure that the difference was due to the tubes, I tried to exchange tubes across sockets. Moreover, during the test, I verified that no RF drive reached the tube grids and that no self-oscillation was taking place: the difference was really due to the tubes.

As those tubes are not too common nor very cheap either, I would like to try a workaround for balancing them.

Looking at the schematic diagram I determined that modifying the circuit for having two separate grid bias controls, allowing independent bias adjustment, would be rather complex.

On the contrary giving a small negative voltage to the suppressor grid of the strongest tube would be very easy.

I am aware that balancing the idling current does not necessarily imply that tubes remain balanced also when RF drive is applied to their grid and, in that respect, I wonder whether any one has got experience with balancing tubes by varying the suppressor grid potential.

Thanks & 73

Tony I0JX

The cathode current of a pentode or beam pentode is mostly set by the voltages on grids 1 & 2. While changing the voltage on the suppressor or beam forming plates may or may not change the plate current, it won't have much effect on the cathode current. In other words, if you use the suppressor to reduce the plate current, the screen current will go up by about the same amount. This could cause the screen dissipation to exceed its ratings.

If you try this, watch the currents in the other elements as well as the plate current.

Hi, Randy,

Take this for what its worth, Randy, but once upon a time, a long, long time ago:

I was trying to polish up an S-38, it may have been a little earlier version than the "D",
I could see quite clearly, that one of the red (I think) dial pointers looked like it had a crack across its
length.Well, clumsy me, I teased the pointer a little with a toothpick and the whole end of the
pointer fell off.

Upon closer examination, I could see that the metal from which the pointer was made was very
thin aluminum, almost like foil. It had apparently been dipped in some kind of red paint or goop,
and when the paint or goop dried and cracked, there was precious little holding the pointer
together, so my probing finished it off.

Under close examination, it looked like the pointer was of pretty flimsy aluminum foil, cut to shape and creased once down its length before dipping it in the red paint/goop.

Pop cans were steel in those days, so I'm not sure what the supply source was for Hallicrafter pointers. Mine ended up as (I changed them both) flat style toothpicks, dipped, yes, in red paint/goop.

That is my story, and I'm sticken' to it!

Gene,

That was one of my favorite shops.  It was one of several surplus stores in the
area, but it had the most extensive selection of all of them.  It was located at
1240 Market St. In the next block to the North-East of Fox Plaza.

73.......Allan

Gene's not here. While you at least didn't reply to his old message, you are posing in response ot a message from 2009. Chances are good he's not reading the newsgroup anymore, and according to google, that was his only message to Usenet (at least from that email address), so he was a hit and run poster.

Michael

That's an easy one, Garry! The first model
selling in 1946 (no letter suffix to the "S-38")
had a proper BFO and a tune control for it.

The original 1946-47 6-tube S-38 is the one to use.  Has a proper BFO.

The K9YA Telegraph is a FREE, monthly, general interest amateur radio publication read by Hams in more than 100 countries. The K9YA Telegraph contains the stories and features most wanted by our readers, because it is written by them. An e-Zine, it is delivered monthly as a full-color PDF file.

The January 2013 issue will begin our 10th year.

If you're in the mood for Morse, hankering for history, gluttonous for gear, ravished for a review, needing nostalgia, or just plain famished for fun, you'll find it in the K9YA Telegraph.

To check out sample issues, subscribe or write an article, visit the K9YA Telegraph Web site.

Hi all,

I'm repairing an old Geloso G.222 TR transmitter for a friend (this is the first version, I understand there were two issues from the schematics I've found on the net).

First of all, this set has been modified with two relays for transmit/receive antenna changeover and HV switching. I don't know if this mod was common back in the days or not.

Repair so far consisted in using silicon rectifiers in place of original selenium bridges (all were leaky), changing almost all electrolytics (almost all were too leaky and couldn't be reformed, so I also changed the only two ones that seemed to start reforming with voltage applied). I replaced all resistors that had drifted more than 20% in value and replaced the resistor inside the 6164's plate suppressor (original 33 ohm resistor was broken, replace with 47 ohm 2W carbon composition as I didn't happen to have a suitable 33 ohm one), finally replaced the 6146 final tube that was dead (getter was white despite no apparent external damage in the glass envelope). Replacement was a NOS W8289.

First thing I noticed (my usual experience with tube finals are more modern Yaesu and Kenwood hybdrids) is that the 6146 has no bias setting point, so I'm a bit puzzled about how it is supposed to work without burning.

I found in the technical bullettin n.83 the schematic and alignment instructions. The first thing I noticed is the G1 of 6146 is supposed to be at -85V in CW tx. How is that possible since the only negative supply in this transmitter is -50V? I infact measured -50V when in CW mode, but I didn't key the transmitter as the 8289 died before I could try.

When I started the first TX experiments, I tried on 80m band AM mode, with 50 ohm 500W bird dummy load connected at the antenna socket. I could obtain 50W out with plate capacitor around middle position and loading capacitor fully meshed. That was with no modulation, carrier only, so far so good.

I tried on 40m band and power was much less, and 8289 started to show signs of red spots on the plate. On the higher bands, problem much worse, almost no power and 8289 plate glowing soon after going into TX, no tuning of the plate capacitor seemed to help.

These tests, even if short, killed the 8289 which cracked the glass under the plate cap... I think it was a marginal tube, because I didn't allow the tube to remain in TX as soon as the plate was starting to glow red.

Relay contacts were cleaned and contact resistance checked before the tests.
The Pi coil is rather oxidized (it is not silver plated, so copper oxide grew
on it), I tried to clean it the best I could. Is there any way to test if
the coil is still good enough?

Grid bias of the 6146 in AM mode appear to be 0V + vfo driver (about 100V pp),
is this correct? As I said, I've never seen a 6146 with no negative grid bias
anywhere else. Grid bias in CW mode is -50V but I never tried keying as
the 8289 was already dead when I was checking this.
Now I'm shopping for another 6146, can the 6146B work in this transmitters?
I have several used 6146B as they're common in Yaesu and Kenwood transmitters,
but no plain 6146 or 6146A.

Any other hint is welcome! I'd like to hear from G.222 experts if any :-)

Best 73 and season greetings

Frank IZ8DWF

hello
I also have a g222 tr first generation ,that has no problem for now...(I touch my wooden head!!)
It seems that you have an excessive dissipation of your 6146.
What is the current of plate?
Check the vfo,does if give enought power,does the small variable condenser at its output work?
Do you have enought excitation on the grid?
What is the voltage of the G2 of the 6146?
On the first version of the transmitter it is provided by a small separate transformer and power supply,this small power supply is used for the vfo ,the two first tubes on the modulator and the G2 of the 6146 .Also change this rectifier (tubular one,black) I did the same modifications than you :replaced chimical condensers and rectifiers,for the rectifiers I used small 'bridges 'with 1N4007.
I am not a specialist of those machines...it is just the first tx I knew 45 years ago at my grand father's station...
it is just some ideas.
Also a way to save your pa tubes until you find the problem would be to

decrease the hv ,so decrease the plate dissipation ,I have used a variac to
underpower the transformer,not standard but it helped me.
73 F1GQB
It is my turn to ask a question ,I also have a geloso g209 receiver that has
some problems:from times to times one of two second lo stops (the one used
on am,and usb,the one used in lsb works),it seems a thermal problem,I used
antioxidation produtcs,I reshaped the contacts,I resoldered everything,It
continues,
what can it be????

unfortunately I didn't pay attention to the value as I was paying attention on the plate colour and other sign of problem, like smoke somewhere. It was on the very first TX tests and the final tube lasted too short a time.

> Check the vfo,does if give enought power,does the small variable condenser
> at its output work?

yes the driver tuning condenser work, but what's "enough" output?
I can measure the RF voltage at the grid of the 6146 but how can I tell what is supposed to be the right drive voltage?

> Do you have enought excitation on the grid?

on the service information I haven't seen any indication on what's enough excitation voltage. I'll try to realign the VFO again for maximum output on all bands

> What is the voltage of the G2 of the 6146?

it's 210V at no load

Can you check what DC voltage you have on the 6146 G1 when TX in AM mode?
Can you confirm G1 bias is -50V in CW mode?

> On the first version of the transmitter it is provided by a small separate

yes, I also used 1N4007.

> I am not a specialist of those machines...it is just the first tx I knew 45

well yes, good suggestion. I didn't expect the tube to die so quickly. I
once repaired an old Yaesu FT-101E that had a failure in the 6JS6C grid bias
circuit and basicly it had no negative bias on control grid, so as soon as the
heather was switched on, the tubes would start drawing a large amount of
current and the plates were glowing bright red. I of course switched off
the set as soon as I saw the plates glowing but I think the owner didn't
realize wath was going on since most of the wires around the power transformer
were carbonized. It's amazing that the power transformer itself survived
and what was amazing too is that those tubes still were putting 50-60% of
their rated output power after the problem was fixed and many wires were
changed.

if it has two separate xtals for USB and LSB, check the xtal socket and
the tuning of the oscillator. Try gently moving the USB xtal and see if
RX come back again.

Thanks and 73

hello again Frank,
as there is no indication in the documentation of what is the normal output
power of the vfo,maybe it would be useful to use new 6cl6 and 5763,also an
indication of grid excitation is useful,on my set the excitation
potentiometer is about 1/4 turn to get the 3.5 ma required on 80M
with the driver tuning condenser correctly tuned,this can be checked in
RECEIVE position of the transmit/receive switch(but this has maybe been
modified in your set
) AND the am/vfo-beat/cw switch in vfo-beat:this powers up only the vfo,not
the
pa ,this is used to tune the tx to the rx frequency(heterodyne).In this
condition you can get an indication of the excitation,without using the
pa,you should not have hv
so no risk for the pa tube,but I am just wondering
what are exactly the modifications don on your tx...
-why not try to put it back in its original condition by removing all those
relays
Hope this helps
73 alain F1gqb
thanks for your suggestions for the rx,I already dit it :-(((

ah that's why... It's working in C class with G1 current! I would never
expect an AM TX final amplifier to work in something else than A or B class.
Thanks for the hint. Do you know if this protective bias should be present
also when the G.222 is operated in AM position?

Tnx,

I see I have VFO output when the switch is on the VFO-BEAT position but the
output to the grid of the 6146 is smaller than that I can measure in AM
position. I need to check from the schematic if this is correct.

this isn't possible, the original T/R switch is missing, at its place there is
an on/off switch that just energize the two added relays. The DC for the
relays has been obtained with a doubling rectifier on the 6.3V AC heather
supply.

The following was posted on the Boatanchors Reflector
by William Watson <wwatson5@sbcglobal.net>

Quote
 >Because of illness, I need to sell the following collection of
boatanchors:

Motorola R-390A, with tag, looks nice, with top and bottom covers,
works well. Racal RA-17L Looks very nice, with rare original cabinet,
works well.

The following are are unrestored but good restoration candidates:

Hallicrafters SX-42
Hammarlund SP-600-JX-17 With rare original cabinet (square holes)
(2) National HRO-50 with miscellaneous coils
(4) Hallicrafters SX-28 (or SX-28A) 3 are in original cabinets,
    1 is not in cabinet.
Hallicrafters SX-100,
Hallicrafters SX-25 Has had sloppy repainting
Hallicrafters SX-101
Hallicrafters SX-43
A little rough Hallicrafters SX-71
National WRR-2A The big Kahunah, a little rough

In addition there are several odd Hallicrafters chassis and cabinets,
I think mostly SX-71

All of the above is being offered as a lot, to be picked up at my home
in the Oklahoma City area.
All must be taken. I am unable to pick them up, so bring enough
manpower to load your truck.

In addition, I will invite the buyer to look over the contents of two
10' x 10' storage units and take anything that is there.
There are some old radio consoles, lots of power supplies and other
goodies, some steel carts, etc.   I also have a very nice large steel
shelf unit on wheels that has thick wooden shelves that I will throw in
if the buyer wants it.

$3000 firm.

Unquote

If interested, please contact William Watson
<wwatson5@NOSPAMsbcglobal.net> directly.
Remove the NOSPAM from his address.

Please do not contact me (Ed Knobloch), I am only relaying the info.

indeed this is correct, the modulation is applied to the final amplifier,
so it can work in class C, thanks again for explaining.

here you can find the schematic:

http://www.qsl.net/i0jx/222.gif

Probably since in AM mode there's always present the VFO drive, they thought
it would be enough to just trim the drive voltage while monitoring the grid
current to remain in the safe range. If this isn't the case, there must be
a bad contact in the mode switch because indeed in AM mode I don't measure
any protective bias on 6146's G1.

Do you see any reason not to use a 6146B as final tube? I have a few of these
but no 6146/6146A left.

Thanks again and 73

ok, that's what it seems to me too (the circuit drawing isn't also very easy to follow sometimes), and that's what I can measure on the real thing.

I agree, if you don't monitor the G1 current in AM mode, the 6146 will not survive for long time.

By the way, I ordered a new 6146, the PA has no neutralization circuit so probably even the 6146B would work fine, but none of my used 6146B is in a known state, so I would just add other unknowns if I'd try with them.

Subject: My 1st new Electronics website--any ideas??
From: Flipper City Phoenix <carrol69@gmail.com>
Injection-Date: Fri, 21 Dec 2012 17:07:41 +0000
Content-Type: text/plain; charset=ISO-8859-1
```

I just put up my 1st website & i'm looking for any ideas or changes I should make. Its free to list & I plan on keeping it free!!! Electronics related only.

I've been into electronics all my life from making pcb's & building synths as a teen, Selling parts at Ham conventions, Rebuilding tube radios, pinball/arcade repair service centers, midi synthesizers/keyboards & guitar-amps.
Over time I've bought out ops, dealers, houses filled with antique electronics etc. & I have accumulated a mass of parts,boards, equipment etc.
I'm 54 yrs old now & its time to clean out!!!

A year ago I listed a bunch of redemption parts online auction & they took all my ads down because I
 didnt know what exact game they went to & that really pissed me off!! & the petty charges kept adding up. So I said I'd like to have my own site. Now I can list items & let them ride. I thought why not let others list as well.

When theres enough people I'll add the AUCTION button!!!

IF YOUR BORED & WANT TO HELP GET THIS STARTED--LIST A BUNCH OF STUFF!!!

everybodyslist.com

Thanks for your time & MERRY CHRISTMAS!!!
Carrol
AKA Carl

The handbook for the SP-400 indicates +380V on both the power supply schematic and on the tube chart. There are two handbooks on BAMA and a military handbook for the three versions of the SP-200, also for the SP-110. Its been a long time since I had my BC-779 out of storage but seem to remember the voltage seem high to me. The RCA tube handbook does indeed give 375V as the maximum plate voltage for the 6F6.

I think my copy of the military handbook was on an archive drive that crashed, at any rate I can't find it to check the earlier values. The tubes _do_ run hot.

The 380 volts is only used for the audio output tubes. If you don't need the full 10 watts of audio, I'd just use the 270 volt supply.

Dear Richard,
My transformer was manufactured by ACME electronic. Usually this
type of transformer, works hot due to saturated core,� but not super
hot�.
As you reported, I suspect that the cap. is leaking, it's worth a
look, even due to aging. I recommend use of capacitors in parallel, at
least 3 for splitting the current (1Kvolt rated), 3 x 470nF, works fine
in mine.
I got my 190A via ebay in hong kong two months ago, and after about
20 min. turned on, the pilot lamp extinguished and the equipment comes
down.
Now, its ok.

Greetings !

```

Agreed, although you might lose a little linearity.  Those 6F6s will last a
WHOLE lot longer though.

The K9YA Telegraph is a free, monthly, general interest amateur radio publication read by Hams in more than 100 countries. The K9YA Telegraph contains the stories and features most wanted by our readers, because it is written by them. An e-Zine, it is delivered monthly as a full-color PDF file.

If you're in the mood for Morse, hankering for history, gluttonous for gear, ravished for a review, needing nostalgia, or just plain famished for fun, you'll find it in the K9YA Telegraph.

To check out sample issues, subscribe or write an article, visit the K9YA Telegraph Web site.

The tube manuals that I have declare that their ratings are "average expected values" or something like that -- basically, they are numbers to be followed when your set is plugged into the wall and the line voltage is 117VAC (or 110, depending on the year), but they are not ratings which will lead to immediate and catastrophic failure if they are exceeded.

Tube failure conditions to not have as sudden an onset as semiconductors -- so industry practice was often to sneer at the tube ratings as you passed them by, and accept a lower tube life in return for a less expensive set.

Lowering the supply voltage to those tubes will reduce the maximum audio power a bit and let the tubes run cooler, which will make them last longer. Since you can no longer schlep down to the local five and dime to get tubes cheap, that may not be a bad idea.

Thanks Renan, I don't remember who made the transformer in my 190A. I will have a look and see about getting into it. It gets hot enough to melt the potting material. The transformer in my 260A Q-Meter is cool to the touch even after its been running for an extended time which makes me thing this one should be the same.

I made a deep search on Google looking for sockets suitable for lighthouse tubes type 416B or 6280. No hit.

Neither SSN nor Fair Radio seem to have them.

Would any one be able to indicate me where I could buy a few of them at a fair price?

Good morning from Greece,
please exist anyone who have a credible circuit for fm
amplifier(87,5-108mhz) that uses tube 3cx1500 to send it to me?
If you attach photos would be a great help...
Thanks.

If it's for FM, it's not a linear.

It's the wrong frequency for this newsgroup, indeed if you're talking

about such a high power tube you aren't in the proper league to build it
yourself.

Michael

If it's for FM, it's not a linear.

Try the Broadcast Electronics FM-1B, which used one of those 8877s as the
final. They were solid and reliable and turn up surplus at reasonable
prices. You should be able to find schematics online.

>If you attach photos would be a great help...

Surplus FM transmitters are far cheaper than attempting to build your own.
Try Mooretronix or Armstrong Transmitters, both of which should drop-ship
to Greece.

The 8877 will need about 100 watts input power for FM broadcast use, so
it's not like some of the tetrodes which can just be driven right off a
10W exciter. Remember, it's not a linear... you _have_ to provide enough
input drive or it won't turn on at all. No, a 6146 won't provide enough power.

Dear Scott,
thanks for the update, if you attach me a link for the fm amplifier by
tube 8877 will help me a lot,

Alex

The meter has died on my military TV7D tube tester. I was unsuccessful
when attempting a repair. It appears that the moving coil is open.

If anyone has a junker that they could spare the meter from, I would
very much like to hear from you.

Thanks,
Larry W4LK

There are still people who will repair meter movements.

Try Bob Larson at Larson Meter Craft.

<snip>

Hi, Larry
I can't help you with a replacement meter,
but I thought you'd enjoy seeing
a website where the owner, Dieter, rewound a TV-7 meter.
Step one was to run a blowtorch over the face of the "sealed" panel meter:

http://www.jogis-roehrenbude.de/Roehren-Geschichtliches/Roe-Pruefer/TV-7-Restauration/TV-7-Restauration.htm

I am in awe of Dieter - what a craftsman!

There was an article in "Electric Radio" a few years ago, about a TV-7 meter replacement using an LCD panel millivoltmeter, with the proper resistors to match the original calibration. If you need it, I will search.

73,
Ed Knobloch

Here's a write-up from the Texas Antique Radio Club for installing a
digital replacement:
<http://www.tarc.gvtcwebspace.net/#/tv-7-meter/4562544089>

If you can find another 200ua Phasotron meter, you may be able to adapt
that as outlined here: <http://www.n2xp.com/tv7tube.htm>

hello,I am repairing a Stoddart NM52A(360mhz to 1ghz rx),it is
incomplete,someone took the input attenuator and parts of the input relay
system,the power supply is also incomplete.Otherwise ,it is in splendid
condition,
it was perfectly well preserved in its boxes.Is there someone who has the
schematic?
a look at google was unfortunate...
thanks ,73

I have never been able to find documentation for old Stoddart gear.  They
are now a division of AR... you could try emailing someone at info at
ar-worldwide.com and see.

I have a couple VLF field strength meters that I'd love schematics or even
operating manuals for myself.

http://online.sfsu.edu/~hl/src.html has a little history of the company
but not much real info.

hello,thanks for your answer,I also have a nm67 and a nm57,all working
well,no documentation of course!!!
they are very useful to measure gain or nf of preamplifiers,or simply as
receivers.I have been using the nm57 on 137 mhz during lots of years to get
pictures from wheather sats.
The nm52a works well,I rebuilt the power supply ,made a connector between
the power supply box and the receiver(necessary voltages are written on the
front panel),and rearranged the input circuit ,because the input attenuator
and the calibrator circuit was removed,but not the noise diode;the two
relays connecting the rf heads are also present .It works I get airplanes
around 375 mhz,lots of stations around 400 mhz.I added a wide band lna,and
it is fantastic!!!!
Is the anyone that has some information:sensitivity,nf,frequency and
bandwith if the if,and some other things.???
73,best regards F1gqb

I have an NM-12AT! I never did succeed in getting manuals for mine.

>they are very useful to measure gain or nf of preamplifiers,or simply as

That is pretty sensitive. The NM-12AT is not sensitive enough to get
the local airport beacon, although it will detect a signal from my

signal generator. I do not understand the calibration and meaurement
procedure and my suspicion is that the front end is damaged because the
sensitivity is so poor.

>Is the anyone that has some information:sensitivity,nf,frequency and

No, I wish I did!

Thanks for all the suggestions, guys.  I will consider my options,
although, the digital meter looks easy and inexpensive.

hello ,to have a few informations about your
NM-12AT,just ask google..you will find a pdf with pictures
,accessories,specifications...it seems yours has a problem,if you cannot
find the problem and repair it,you can maybe increase the sensibility by
adding before the receiver a preamplifier ,in your case maybe a low nf
operational amplifier ,Maxim and AD make execellent.Your receiver will not
be repaired but can be more useful.

I found nothing for the nm52
best regards

I don't find anything at all on google, searching either for "stoddart nm-12at"
or "singer nm-12at" other than a page on scribd.

It is fairly simple inside, it should be very easy to repair if I can get
a schematic.

I am not an expert on dynamotors but this doesn't sound right. A dynamotor is a motor connected to a generator. The load on the motor should reflect the load on the generator so that when the generator is running open circuit the motor should not draw much current. Make sure the bearings are not seized, that is that the shaft turns easily (if you can get to it). Its possible either the motor or generator windings are shorted.

I am not familiar with that particular dynamotor, so I am unable to tell you which lead is positive and which negative (although it should not be too difficult to determine it).

In all cases, please be informed that dynamotors typically have a very high inrush current. If you use a modern stabilized power supply, the overcurrent protection will surely trip.

Possible solutions are:

- to use a plain suitably-sized non-stabilized power supply (just a transformer, diodes and a capacitor)
- to feed the dynamotor with a car battery kept steadily charged by (any) suitable power supply

After problem will be solved, I fear you will anyway want to build an ad-hoc P.S. replacing the dynamotor. Most often dynamotors are so noisy one can't stand them!

Others have pointed out that the inrush current (starting current) will be far greater than your 25 amp P.S.   Using a battery, and just charging it with your 25 amp power supply may work. I have used a protected power supply by disabling the over current protection circuit. (not something
I recommend, however)

Some of them will run properly in reverse, and of course you get reverse
voltage on the output.

>In all cases, please be informed that dynamotors typically have a very high
>inrush current. If you use a modern stabilized power supply, the overcurrent
>protection will surely trip.

Figure if you have a 25A running current that your starting current is 50-75 amps. Not for very long, only for a very short time. Adding a big capacitance can help if you're stuck using a current-limited supply.

HOWEVER, if you see anything higher than 25A running current under load and it's rated for that, something is wrong. Before I would fire up an old dynamotor, I would pull the thing apart, remove all old grease on bearings, and relube everything with modern lubricants, and I would check the brushes at the same time.

Old and crusty lube will increase your starting and running current and eventually damage the bearings and overheat the motor windings.

>After problem will be solved, I fear you will anyway want to build an
>ad-hoc P.S. replacing the dynamotor. Most often dynamotors are so noisy one
>can't stand them!

That's why you put it in the trunk of the car where it belongs.

Many of the older HTs like the Motorola HT220s and the Bendix-King sets have simple screw-in studs for the antenna connections. Is there _any_ way to adapt these for a BNC connector without major surgery? I could readily make a connector that screws into the antenna mount and has a BNC on the other side, but where does the ground come from? Did anyone ever made a commercial

solution for this? Is an HT220 really a boatanchor? Have you ever had to carry one cross-country?

I'm speaking as a guy who controls motors for a living, not someone who's ever even touched a Dynamotor. So size your grain of salt appropriately.

First, everything that Scott says about making sure that the Dynamotor is up to snuff before you start is good advice. I would add to Scott's advice that while you're checking brushes, you make sure the commutators are in good shape -- if they're all corroded, then you should be thinking of rebuilding the thing. Check both the generator side and the motor side.

I'm not sure about the start-up current only being 3x the run current, unless that's run current while loaded, and an unloaded start. DC motors _really_ like to run at a speed determined by their terminal voltage, and will draw _lots_ of current starting from a stop.

If you have a power supply that gracefully limits the current to 10 or 20% higher than the unloaded run speed or just enough to overcome the starting bearing friction, whichever is higher, then it'll almost certainly bring the motor up to speed, albeit more slowly than just strapping the thing onto +12V (or whatever its run voltage is).

If your power supply does something unsociable in the face of too-high current, like shutting off, you can try this dodge:

1: measure the terminal resistance of the motor. Do this while rotating the motor in small increments, stopping, then measuring -- the resistance will change depending on the brush position on the armature. Choose the lowest resistance measured for the next step.

2: find the resistance that you can hang off of your supply such that at rated voltage you don't exceed the maximum supply current. Subtract the motor armature resistance from step 1. Remember this number.

2a: if you're lazy, just assume 0 ohms of armature resistance in the motor, and calculate your resistance from the supply's rated voltage and current.

3: calculate the resistor dissipation (P = I^2 * R). Go shopping for a resistor. You can probably go about 1/3 as much power as you calculate, because if the motor starts at all it won't draw that much current for very long (and if it doesn't start, you know enough to slap the power switch off, don't you).

4: wire your resistor in series with your dynamotor, with a switch to short out the resistor at need.

5: switch the switch off -- this is your start position. Turn on your power supply. If the motor starts spinning -- horay! If it doesn't -- slap that there switch off before you burn up your resistor.

6: when the motor seems to be going as fast as it'll go (or if you have an ammeter in there, when it seems to settle out to a minimum), switch the switch on. There should be a current spike (hopefully not enough to screw up your power supply), then the motor should settle out at a slightly higher speed.

7a: tell your loved ones not to sue me if you die

7: turn the HV side on

I am helping an elderly gent sell of his items before going to a care facility.

He has a Signal Corp MK II No. 19 wireless set dated Sept 1944 from Philadelphia which he purchased in 1951 and was new then. It seems to have every conceivable piece of equipment it could have come with. Including the spares box with a Morse Key, variometer, signal generator, amplifier, grill cover two sets of unused 50' cloth-covered wire, two microphone marked #7, a power unit, head phones, brackets and much more. It appears almost mint. NO damage or rust stored ina dry environment.

He did tell me he converted it to 120V in 1951, listened then lost interest and put it away.

What can or should I do to sell it? Yes, I have pics of everything

There is a Wireless No. 19 set mailing list on Yahoo, where a lot of the users of those things hang out. That's the first place I would try.

If it's a complete set you might consider Ebay as well.

These radios were a British design, but a lot of them were made in the US and in Canada for lend-lease to the UK and Russia at the beginning of the war. They are, actually, pretty godawful radios. Receive IF wide as a barn. Thousands of the things flooded the market after the war; there were ads in QST for the complete system including the dynamotor for $50.

Because there were so many of them made, I don't think you'll get a lot of money for the set even if it's in very good condition. But a lot of people used them until they could afford something better, so you might find some nostalgic folks out there.

If yours is anywhere in the mid-Atlantic region, I would like to take a look at it. Not to buy it, but I have a No. 19 that has been badly butchered and I'd like to see the filament wiring layout on a good one.

```

OMG, What a wonderful time we had with a complete set in the late '40's. We called it a "Tank set". Ours had English and Russian panel markings. The headsets, keys, and microphones were used on all sorts of home brew (surplus conversions) It included a VHF transceiver, which we actually were able to make a two way contact between two "tank sets". I don't recall if the frequencies were even on a Ham band.

What a wonderful whine the dynamotors emitted until the car battery died. Had to be sure to park on a hill to get the car started after half an hour operating "mobile" with the included whip antennas. W7KGV, W7MGG, W7LAN, W7FXD, W7LTQ.

The VHF transceiver fundamental can be set for the 220 Mhz ham band, but
because of the drifting and the AM modulation, they take up pretty much the
whole band.  Also the spectral purity is... not exactly good.  I would not
not recommend firing one up today.

But that's not really unique to the Model 19.

Assuming it's a superregen receiver and modulated oscillator, that sort of thing homesteaded the vhf and uhf bands. They were great when there was little use, they were simple to build and cheap, it got people on the air. And then "civilization" would come along, fancier equipment and a desire for DX. So they were banished from six metres (maybe when it was still 5 metres?) and moved to 112MHz or if after the war, 144MHz, made an impact and then were banished from there. 220 next, to the extent that 220 was ever used, then 420MHz. Those APX-6 radar transponders were more complicated (but had the advantage of being cheap surplus) but did the same thing for 1215MHz, a simple transmitter with a broad receiver to match.

Decades later, all those cheap doppler radar gizmos converted for use on the 10,000MHz band was similar.

One could even argue that the Heathkit Lunchboxes were in a similar vein, simple and cheap, yet more civilized since the transmitters were crystal controlled. Though of course, there never was a Heathkit produced "220'er" (I'm sure I've seen a modification article where someone put one on 220MHz) or a "420'er" (but there were early CB sets that had similar innards, and one article in "73" about 1968 that was a fairly cheap and easy transverter made out of juice cans that was intended for a Sixer or Twoer.

Scott-

I do not know if there is an easy way to get to the antenna's ground
terminal, but had a related thought. Some of those old HTs worked with
a separate speaker-microphone that had an antenna mounted on it. You
may find a better antenna connection through the speaker-mike connector,
since it would be a co-axial connection there.

I have seen photographs of HT600's (Genesis series) radios where the center wire of the coax was connected using an appropriately threaded brass bolt to the antenna socket, and the ground (coax shield) provided by a smaller bolt in the hole that holds the programing cable or other accessories in place.

That's worthless, it doesn't even have a 6146 in it. Real 2 meter rigs have a 6146 on the output. I've got one in the shack to talk to the guy hanging on the tower adjusting the HF antenna.

>You are going to need to get away from the walkie talkie mentality, and
>the hitting the one or two local repeaters and thinking that it makes
>you a ham.

My walkie talkie doesn't have a crystal for the local repeater. If I want to talk to the local repeater I need to use the Heathkit Lunchbox or the aforementioned real 2 meter rig. The walkie talkie is for talking to the guy on the tower adjusting the HF antenna.

>Even just in my situation, I put up a Diamond V2000 antenna above the

Hell, I can make contacts 100 miles away with 0.1 watts out of a signal
generator into a key. In fact, I have 34 states so far doing this (and if
anyone in Idaho with a good 40M beam is reading this, I need some help
on the 35th).

>This is something you cannot do with a walkie talkie, even with a mobile
>external antenna.

Actually, I have an HF walkie-talkie made by Racal, and I _can_ make
contacts 100 miles away with it. 5W SSB into whip and so far I have
20 states on that (also looking for Idaho by the way).

>Unfortunately, the ARRL and the clubs are afraid to tell their members

>washed, they believe that what they are doing is still ham radio.

That's nice, but what the hell does it have to do with my question about
antenna grounding for an HT220?

>Go buy yourself a real radio and get on the air and talk to people from
>other places and if you don't have a General or higher class license,
>put your nose in the book and start studying and upgrade your license
>privledges...

Real hams build their own radios, they don't buy them. Right now I am
trying to build an antenna adaptor for my HT220.

I have seen the solid state replacement using the octal base for the
tube.  I have a Hammarlund HQ 145XC that uses it, and it runs hot after
an hour or so.  Just wondering if anyone else has used this replacement.
I found it for $9.99 on Tubedepot.com.
Thanks

Hi,

I looked at the solid-state plug in ad, but it appears
that it doesn't include a series resistor to drop the voltage
downstream to the same value as when the original 5U4 is used.
If it did, the solid state rectifier plug-in itself would run very hot.

I suggest you add a 200 Ohm 20W wirewound resistor
between pin 2 of the 5U4 tube socket and the input
to the HV filter choke/first electrolytic.
(Hammarlund might have used pin 8 for this purpose, also,
but the schematic shows pin 2).

The 5U4GB drops about 50V at its max rated current, 275mA,
per the tube data books, compared to less than a volt
for the plug-in replacement. That's why the external resistor
is required.

73,
Ed Knobloch

I've never used a purchased solid state replacement, but in days of old many of us tried
a do-it-yourself replacement. Most had good results. I didn't. I don't recall using a dropping
resistor as Ed suggests, but it sounds ok. What I had problems with was the solid state
diodes I was using had a much sharper cut-off (reverse current cut-off) that generated
a little RF hash that interfered with weak signal reception. There were others that experienced
the same thing. I was not alone. My RME 4350 ran hot, alright, but propping open the hinged
access door on top helped a lot. Ed, what did others do to stop the sharp cut-off hash?

Hi, Chief

In case of increased hash with the solid-state rectifier
replacement, I'd add two .01 disc ceramic capacitors
to the 5U4 socket, across pins 4 and 2
and 6 and 2. The capacitors should be rated at 2 KV.

73,
Ed

Thanks for all the good advice. It seems like I would just be better off
keeping the tube! I knew that guys on this group would come through with
the solution.

OK I didn't see this post when I replied. The up-scale reading of the S meter does suggest something is wrong with the bias. Have you checked the voltages around V13a? It is also worth swapping V13 in case you have a gassy one. My other suggestions don't apply other than getting the disc I mentioned.

Thanks Richard. Yes I checked all the obvious stuff first...RF gain control, persnickety "RCV/TRCV" slide switch on the side, antenna bulb fuse etc. Also removed and checked the trimmer and coils of the IFs. I'm now focused on a -0.25 VDC bias measurement on the 2 IF tubes instead of the -0.10 VDC shown on the voltage chart.

Will update as progress is made.

Ernie, I think you may get more help by joining one of the Drake mailing lists. There is one at:

http://groups.yahoo.com/group/DrakeRadio/join

and another at:

http://mailman.zerobeat.net/mailman/listinfo/drakelist

Nearly the same people on both. In particular Garrey Barrell is quite expert and may know what has happened immediately.

Problem found.

Actually two problems.

In addition to the atypical grid voltage readings on the IF tubes leading me to suspect AVC involvement, R195 (68 ohms) that feeds the cathodes of the IF tubes (V11 and V12) and is delivered to those tubes from a jumper from V5 (6BA6) was open. Once replaced, I still had very low voltage (1/2 volt) instead of 1.5 volt on the cathode. What else can be left? The filament? Hey those things NEVER go bad, right? So I checked the filament voltages and, while V12 was good (12.8 VAC), the 1st IF (6BZ6) was missing. Back and forth a hundred times checking the little white wire from V5 that feeds the filaments too but it was good. I look at the filament string on the schematic and there's a 0.005 uF capacitor in parallel with the filament of V11 which was good. Here's the very odd thing: Of course the filament for

V11 uses only one side of the leg of the filament string to develop its voltage BUT MY VOLTAGE CHART SHOWS IT SHOULD BE 12.8 VAC. In addition, it is clearly silk-screened on the chassis of V5, "12BA6." But yet the voltage chart refers to V5 as a "6BA6." Figuring I'd better double check the 6BA6 or 12BA6 or whatever was in there I discovered it was a 12BA6 with its lettering almost rubbed off. Voila. Exchanging the 12BA6 for a 6BA6 immediately returned my filament voltage on V11 to 6.3 VAC (so I notated the correction on the manual's voltage chart), cathode voltage returned to a healthy 1.5 VDC, S-meter easily zeroed and worked and finally again...hissssssssssssssss.

This transceiver was given to me by a gentleman who said the receiver didn't work very well. I think I know why.

Thanks to Scott, Richard and Garey for your suggestions. They were all good ones but I think Richard's crystal ball may have been closest when he stated, "check the obvious."

I remember reading an article in Readers Digest or some other popular-press magazine with a bunch of factoids about TV repair. One of the things I remember reading is that 50% of service calls were at that time (early 1970s) because the TV wasn't even plugged in.

Then I grew up to be an electronics engineer, and while you'd think I'd have known better, I can't count the number of times I've had the back off of a piece of electronics, or was getting ready to, before I discovered that it just wasn't plugged in, or some switch had been flipped, etc.

"Check the obvious" is good advise -- and advise that isn't always easy to remember to follow!

Hi, gang! I am looking for a Knight-Kit S-8 (I think) which is the matching speaker for the R-100A receiver. Please reply to ac1wye at gmail dot com

My old receiver's IF wouldn't align and I finally traced it down to the IF
can. A grid dip meter shows the primaries and secondaries of each coil are
anywhere from 20 to 40 kc away from the design frequency (460kc). The
trimmers trim OK, but just not close to 460 kc.
I can bring each coil back to the IF frequency by soldering another small
value cap (100 pf or less) parallel to the trimmer. The capacitor sellers
have all sorts of variations and I am wondering if anyone can give me a
suggestion as to what kind would be the best to use for this application?
Thank you.

Silver mica. In a pinch, an NPO ceramic would probably be fine.

BUT... this happens when the capacitor inside the IF can fails. If it failed completely, you're fine. But if it failed partially then adding the cap will only be a temporary measure...eventually it will fail completely and then the value will change again.

So I would suggest going into the can and clipping out the old capacitor if you're willing to risk it, then putting a new silver mica in.

Thanks Scott. Silver mica it is. That's a good suggestion about eliminating
the old capacitor entirely and I will do so.

Grid dip meters are notoriously inaccurate. If the IF is 460 KHz, listen for the meter's 2nd harmonic on 920 KHz with a broadcast radio before you do something you can't undo.

It's especially suspicious that ALL the IF cans are off by the same amount.

I try not to wade in and correct folks' spelling in general, but if
you're doing searches try "voltage stabilizer" -- that may help.

I'm curious what it is.  I know of the VR-300 voltage stabilizer tube,
which is a high voltage cold cathode tube for regulating DC.

Are you looking for an outboard ferroresonant regulating transformer
which would be used _with_ but not _in_ the meter?

Dear Tim,

I would like to thank you for your attention regarding my question,
sorry I have not been very specific, I am referring to an old AC
ferromagnetic voltage stabilizer used internally in Boonton Q meter
model 190A whose reference circuit diagram is VR-300, are two types one
manufactured by Acme electronic, model T-31370 t and another by General
electric model 69G870 (input 95-130 volts, out 115 volt,60 HZ, 50 VA
power), I know that a simple power transformer would solve the problem

```
although it is more sensitive to variations of the electric Net, If I do
not get an original, I'll have to make a slight modification, although I
would like to leave it original shape.
Thank you so much one more time !  Renan  pp7hp

Actually, you should not need the thing at all, you can just bypass it completely if you trust your line voltage.

I have some Sola equivalents around here somewhere, and Sola still makes a direct replacement. That would be a Sola CVS series, type 23-12-060-2. Newark should have them in stock.

Note that these MUST be used on 60 Hz power. Very bad things will happen if you try and use one on 50 Hz. So if you are living in a 50 Hz country and it has been removed, it was probably removed for a reason. You may be able to order a 50 Hz variant but I don't know the Sola number offhand.

But note that in the 190-A if the CVT is removed the line goes directly to the HV rectifier. That may be OK but provides no isolation and perhaps a shock hazard. If a replacement CVT can't be found an isolation transformer would be a better solution than a direct connection. BTW, the CVT in my 190-A runs very hot, not normal I suspect although the voltage out is correct. Its a potted unit so there is not much I can investigate.

    There are two mailing lists that may be of help. One is
the Agilent-Hewlett-Packard list and the other is the
Boonton list.

  http://groups.yahoo.com/group/hp_agilent_equipment/

    http://groups.yahoo.com/group/Boonton/

    As you know Boonton Radio was bought by -hp- who
continued to make several of the instruments.   This is a
very active list.  Some of its members started a list
dedicated to Boonton Radio and other equipment made in
Boonton N.J.  Not too active but may be of help.  I suggest
posting to both lists, you may be able to find a part.

I am restoring a BC342-N and need the Crystal Phasing knob (missing) and the "isolantite?" non-conductive shaft (broken/part of it missing) for it.

Please reply with personal email if you can help. Also interested in new tubes for the radio.

thanks in advance,

Highvoltage2010

PS. I also need (2) of the spring loaded phone jack covers. They are
the bottom 2 marked "Phones 2D Audio" - Item 10, p/n 2Z5650-P2A

Check out Fair Radio for the knobs. They should have at least a knob
that is the same size
For the shaft check out McMaster-Carr on the web

It is not a message board. It is a Usenet newsgroup which predates the existence of Google. And yes, there is still a little traffic here.

Robb-

If you come across an 8-pin "octal" tube socket, you can use it.  Pin
spacing of alternate pins is just right for an FT-243 crystal.  You can
also use the socket for two crystals mounted side-by-side.

Richard-

Thanks for the Yahoo groups info. I didn't know about those two.
I joined the Boonton group as I have a couple of 260A's both in
need of repair to some degree. Now if I can just find some time
to work on them...

73, David K3KY

There are probably a few people on one or the other of those groups who know the 260A well. At -hp- all the Boonton stuff was done by a couple of specialists who did nothing else. I think the 260A is reasonably easy to get operational, the 250A RX meter was a bear to get calibrated and the older 160A Q-Meter requires a special tube which was selected. Boonton liked using selected tubes, one of the 202 series RF generators used three tubes of the same type but selected for different characteristics. A royal PITA.

There have been a couple of other Q meters made but the 260A is still an excellent instrument. The trouble is that most people now have no idea of what they do or how to use one.

Have you checked Antique Radio Supply (www.tubesandmore.com)? If they don't have it, they'll have the tube sockets that Fred mentions.

If you've just GOT to have a square socket (i.e., if you're putting it in a radio or something) see if you can file a tube socket to fit. You probably won't be -- but it's a thing to check.

Answering Robb's question made me think of a very mild puzzler:

Can you think of a way to connect up an octal tube socket so that no matter what orientation a pair of crystals is put into it you'll still have two switchable crystals (no forcing pins allowed -- only schemes where the crystal goes into receptacle 1 & 3, 2 & 4, etc.).

And, after you exercise the dozen brain cells that it takes to answer that question -- did anyone do it in a production radio, or publish it in a magazine, that you know of?

Well -- out of curiosity I checked, and ARS should maybe rename
themselves "tube guitar amp supply".

A wider search hit -- of course -- fleabay.  These are white: did you do
a search there?

I don't know, but it seems like the sort of thing you'd find in a Hints &
Kinks in QST, or filler in CQ (they had a book issued in the fifties that
collected little bits, I can almost picture almost picture something like
this in there).

Hallicrafters did it on the SX-25 only they blocked out two of the holes to make the hop-scotch wiring work. The problem you run into is the holes near the key, so I would suggest filling them to make them unusable.

I have to chuckle at the idea that people don't know the value of Boonton Q meters and the 250A RX bridge. I cut my teeth on the 160A and 190A Q meters and the 250A when I went to work for James Millen in 1956.

Forty years later, when equipping a bench for doing some serious work with boatanchors, I located a 260A---got it working, but it was a cosmetic horror, so when someone gave me a non-working but cosmetically clean 260A with a tentative diagnosis of a burned-out thermocouple, I took it. However, it turned out that the thermocouple was not burned out, just had a bad solder connection at one end of the heater wire.

The 260A (as I recall, a 1953 redesign of the mid-1930's 160A) is not particularly difficult to work on. Biggest problem I found with both was poor contact with the oscillator turret pins and open oscillator coils. The open coils all were breakage at the turret pins, very easy fix. But the brass pins and contacts took abrasive work to get them to make contact. DeOxit D-5 didn't touch them.

The 160A used a selected 45 tube for the oscillator, and the thermocouple burned out quite easily. The 260A uses an off-the-shelf tube--5763 as I recall---so that component is a plug-and-play replacement. The 260A thermocouple is much more robust. I've forgotten what was in the 190A, though I've been inside all of them at one time or another. The VTVM tube is selected in all of them.

Boonton supported these units with excellent manuals which go into great detail about how they can be use. That's true of the RX Bridge as well. The Q-meters are not at all difficult to calibrate by the procedures given by Boonton.

When push comes to shove, there is nothing like a good Q-meter when dealing with boatanchor front-end and IF coils. One strand of broken Litzendraht drop the Q of a coil significantly, and having a Q-meter available to get the exact capacitor needed for a silver-mica failure makes life very simple. Of course, a Measurements Megacycle Meter or Millen Grid Dip complement them nicely, but aren't substitutes.

The 250A RX Bridge was, I think, a bit daunting for 1930's/1940's radio EE's. The Chief Engineer at Millen, Wade Caywood, bought one for the company, and spent quite a bit of time experimenting with how best to use it. Mine came out from under a table at a hamfest---not working, but looked brand new, and when the guy said he wanted $20 for it I swapped cash for the bridge and immediately took it out to my car. All that was wrong with it was that the Amperex ballast tube was open, so no voltage to the IF strip heaters. I just used wire-wound resistors to set the voltage. I don't recall having to fix any oscillator problems, but the mica dialectric in the little capacitor at the front of the bridge had to be reglued in place (Pliobond). The bridge was calibrated after it was assembled, so you really do not want to fuss with it.

I'd have to say that to get real mileage out of these boxes, particularly the RX bridge, you've got to know a bit more than you're going to learn from the ARRL Handbooks or Fred Terman's texts.

I have used the Marconi Q-meter, which also uses a special (read "unobtainium") tube, but you have to have both of the power oscillators that go with it. Heathkit made a Q-meter kit that was patterned after the Boonton, but simplified. I had one of these for years, and got quite a bit of use out of it, but the 260A is a step up in capability and accuracy.

I'm not sure what Boonton was thinking when they put the voltage stabilizers in the Q-meters and the ballast in the RX bridge. Unless your primary power is seriously off-voltage, I don't see that they are needed.

Hank

Since you mentioned the Heathkit unit, I have one that I haven't done anything with since I don't have the special inductor to calibrate it. I also don't have any way to measure an ordinary inductor to use as a substitute. Do you know of some other way to calibrate it?

Thanks,

Purchase a reference inductor from J. W. Miller?

When I got mine I sent a few of my coils out to another guy to measure
them.  Then I used his findings to set up my Heathkit.  Everything was
pretty close from the get go.

-Bill

If you've got the unit, you can use a 455 khz IF transformer to check out its functionality. Most of these used in AA5's had coil Q around 100. There are probably ten or twenty different ways to getting a reasonable calibration, depending on what other test equipment you have available and your knowledge and skill in methodologies for using them. Also consider what your intended use of the Q-meter is. For getting front-end coils and IF transformers in a receiver you are bringing back to life, your primary need is to find coil inductance and whether the Q is "reasonable" or "not reasonable." There is a good discussion of Q measurements and a section on Q meters and their vagaries in Terman and Pettit "Electronic Measurements" (2nd ed., McGraw-Hill, 1952). What that makes clear is that absolute measurements with a Q meter have enough error that they're only indicative of in-circuit performance.

Your first calibration point is to set up the injection oscillator. That's a frequency measurement, traceable to NIST through WWV.
The second calibration point is the tracking of the resonating capacitor to the panel calibrations.
The third calibration point is the oscillator injection voltage across the metering resistor.
The fourth calibration point is the voltage developed across the coil at resonance. "Q" is the ratio of that voltage to the injection voltage.

If you've got something like an RF VTVM available, you can measure the two voltages directly. You probably are not going to want to go through the gyrations needed to refer anything but the frequency measurement back to NIST.

A quick search on the net with Duckduckgo came up with this link:

http://www.jamminpower.com/main/260A.html
It's got links to 260A user and calibration manuals. The Heath unit is a cheap knock-off of the Boonton design, so the Boonton material generally applies to it. The Heath unit is quite adequate for repair bench work. The unit I had did yeoman service before I got the first 260A. While mine came with the standard coil, it got its calibration checks with nothing better than a Tek 547 scope and Tek signal generator, with a variety of coils used as a cross-check.

Hank

The 190A uses a diode rather than a thermocouple. The diode runs, I think, in its square-law region and is the only tube in the instrument that was selected. I don't know what measurements were made on this tube. The meter scale will not track properly if the tube characteristics are not right. However, the tubes are very long lived and can not be burned out.

The thermocouple in the 260-A is much harder to damage than the one in the 160-A but one must still use some care in setting the oscillator level.

Both handbooks have pretty good texts on Q and its significance and additional literature was available from Boonton, most, if not all, of which is on the web.

A couple of standard coils for the meters are useful for checking but overall calibration, as you say, does not need them. Working coils are very easy to make.

The RX meter requires some study, it is not a general purpose bridge. Mainly, the Q-Meters are intended for relatively high-Q circuits and the RX-Meter for low-Q circuits. The RX meter is excellent for measuring the RF characteristics of resistors.

All three of these guys, but especially the RX-Meter are true boatanchors:-)

I would like to thank all ones that added valuable informations
concerning to these wonders of electronics, developed in a part of time
where art merges with the knowledge.
With respect to the voltage stabilizer used in 190A, q meter, which
I cited earlier in this topic, I decided to open it, it was not
difficult as it sounds! wrapped in a black sealant (asphalt derived) I
found a transformer with reactor coupled to it and a large oil capacitor
(1.75 Uf / 660 vac, Aerovox) the capacitor was swollen and in short
circuit , as was expected because age. I replaced it by 4x 470uF /
630volts, polyester metallized,When I turned on the electric supply
114volts 60Hertz , the output was 127 volts, I have found information
about this type of transformer in the excellent book (Transforming and
Inductor Design Handbook by Colonel Wm. T. McLyman) recalculated the
capacitor based on the measured voltages, found 1.58 Uf, then removed
one , leaving a capacitor of approximately 1.41Uf (3x 470 Uf), the
output is now 116 volts.
The Q meter is running ok , I hope to get a standard coil to check
it.

I am in the process of building a power supply for my Superpro SP-400-X, and I am bit surprised of the voltages I read on the original power supply schematic diagram.

The voltage feeding the audio amplifier (two 6F6s in push-pull) is 380V, which looks quite high to me.

Does someone know whether the voltages shown on the diagram are open-circuit or under load?

Thanks and 73

I have a BC-779 and maybe a slightly different supply. The voltages under load should be the ones in the tube voltage chart in the receiver handbook. The supply will be higher without load. Be careful of the voltmeter used, the voltages in the handbook were probably taken with a 1000 ohm per volt meter and will read high when using a modern 20k ohm/volt meter or an electronic voltmeter (except for grid bias which were measured with a VTVM). 380V sounds about right to me.

These are very good receivers. The only modification I suggest is adding a voltage regulator tube for the local oscillator plate. A VR-150 mounted under the chassis will work. change the 12K plate resistor on the oscillator to about 8K and connect the VR tube at the tube plate. This will eliminate the pulling of the LO when the RF gain is changed.

I don't know if Hammarlund improved the temperature compensation on the SP-400 but the earlier ones need several hours to stabilize. Once they stop drifting they are quite stable.

Who made the transformer in your 190? I have a 190 where the transformer runs hot. It may be that the cap is getting leaky. It still regulates at the right voltage but is very hot.

I have a BC-779 and maybe a slightly different supply. The voltages under load should be the ones in the tube voltage chart in the receiver handbook. The supply will be higher without load. Be careful of the voltmeter used, the voltages in the handbook were probably taken with a 1000 ohm per volt meter and will read high when using a modern 20k ohm/volt meter or an electronic voltmeter (except for grid bias which were measured with a VTVM). 380V sounds about right to me.

These are very good receivers. The only modification I suggest is adding a voltage regulator tube for the local oscillator plate. A VR-150 mounted under the chassis will work. change the 12K plate resistor on the oscillator to about 8K and connect the VR tube at the tube plate. This will eliminate the pulling of the LO when the RF gain is changed.

I don't know if Hammarlund improved the temperature compensation on the SP-400 but the earlier ones need several hours to stabilize. Once they stop drifting they are quite stable.

--
Richard Knoppow
Los Angeles
WB6KBL
dickburk@ix.netcom.com

The tube manual reports that the absolute maximum plate voltage for 6F6s is 375V. So, designing a receiver with 380V on the plates does not seem to me a good engineering practice. I guess that the 6F6s will become very hot, but evidently they shall survive.

Thanks for the tips on stability.

Thanks for the suggestions and especially the links to more information.
I haven't had time to read them yet but I did download and save them for

when that time comes. A quick glance at them already gave ideas on how
to get my meter going without a standard inductor, although that method
would be much easier!

--
Jim Mueller wrongname@nospam.com

To get my real email address, replace wrongname with dadoheadman.
Then replace nospam with fastmail. Lastly, replace com with us.

Am looking to identify for a friend a military shortwave receiver that was
purportedly used in the Mitchell (B-25 bomber?)--apparently it was general
coverage including the standard broadcast band and about the size of the
1940s-era shortwave receivers from Hallicrafters, Hammarlund etc. Evidently
it was only a receiver and not a transceiver.
Thank you.

BC-348 liason receiver. B-25 also had an SCR-274N command set rack (the
Army version of the ARC-5), but your description sounds like a BC-348.

They had the BC-348 in most of the larger bombers, and lots of them got
sold to ham radio operators after the war. The IF is as broad as a barn
and the stability is poor. They were intended for use with a dynamotor
set to provide DC power so an external DC supply had to be built for them
for home use.

I've begun the restoration of an S-38B. Just started to replace the filters an I already have a question. The old multi-section cap ground is connected to pin 2 of the 35Z5 rather than directly to the chassis ground as shown in the schematic here:
http://i1206.photobucket.com/albums/bb456/Catwatcher32/S38-BFilamentStringFilterCap.png
Pin2 is connected to the chassis ground through the filament string, which has a 125 ohm resistance when cold. Is this a problem or were all S38's wired in this manner?

The filter cap appears to be original but you can't always be certain. It's clear other repairs have been made during its lifetime.

If anyone can recall recapping an S-38 I'd be interested in your observation regarding the filter cap ground wire location.

Thanks,

DaveW

First, I don't have an answer, but am preparing to recap an even older S-38 myself. I think I remember
from many, many years ago, that some of those "hot chassis" rigs had two ground systems, that were actually connected together at some point. Something about "ground loops" and hum
reduction. In the schematic you linked here, there are two different ground

symbols. Could one be the actual chassis connection, and the other sort of a
slightly "lifted" or signal/RF ground? Just guessing, hope someone knows the
real answer!

I checked the schematic notes and the inverted pyramid symbol is the chassis ground. The other symbol is the cabinet ground. Apparently the chassis is isolated from the cabinet except for a single 0.25 mfd capacitor which connects the two.

Yikes! That's why you could get quite a jolt just from the cabinet, and it
wasn't too cool
to use the S-38 right next to a grounded piece of gear. I think I remember
something in
QST "Hints and Kinks" about putting a light bulb (small wattage) between the
S-38's cabinet
and an adjacent, grounded piece of gear. If the lamp illuminated, reverse
the S-38's AC
wall plug.

Back in my mispent youth, I took an S-38B which I had been given, and stuffed
a small 120v output AC transformer in it to use as an isolation transformer.

I also added a little bit of 1960's technology to it, I put two silicon diodes
in as a noise limiter.

In a fit of cleaning out, having long since gotten digital showrtwave radios,
in the 1980's I gave the radio away.

Geoff.

There was a story in "73" in the mid-sixties about someone trading in his
S38 for a better receiver (and obviously cash needed too). So the story
is basically about all the modifications he had to undo to put it back to
"normal". And right when he's at the store, he realizes he's forgotten
one mod, so he takes that out in the parking lot, I seem to recall having
to do some makeshift arrangement to cover the extra hole from that mod.

The isolation transformer wouldn't improve the receiver's ability to
receive one bit, but it sure made it a lot safer to use.

Michael

I have never worked on an S-38 but I don't see how it could work wired the way you described. Perhaps someone botched a recap job, couldn't figure out why a new capacitor caused hum as bad or worse than the old cap, and put it away for some future troubleshooting.

Are you sure you counted the pins correctly and that you are, indeed, looking at the 35Z5 socket?

I checked a tube manual and your schematic shows the correct connections for a 35Z5. The physical location of the capacitor's negative lead should be where the wire from the switch connects to the chassis although some other places are likely to work as well. The idea is to keep the ripple current flowing through the capacitor from getting into other circuits. The chassis has resistance and inductance and this current causes voltage drops that can inject hum into sensitive circuits.

As others have mentioned, it's not the safest way to design a radio, but it did work.

Good luck,

--

Just last week, I came across one for sale near Pittsburgh.
The owner bought it for $3.00 and was trying to sell it for $100.00

Before I approached him, I informed him about the floating ground issue
and how the radio was dangerous and how it needed a transformer to make
it more safe - due to the fact that it was designed for use with 120 VDC
current not AC...

I could have bought it for $25.00 - but was unwilling to drive 120 miles
to go pick it up.
When I stopped by a couple of days later - he had already sold it.

The radio is of little value - since it only did CW AM and has no
SSB....

Just looking on Flea Bay tells me that they had issues with the
cardboard on the rear of the radio - lot's of reproductions.

It would be ok if all you wanted it for was to listen to local traffic
on the 11 meters - since it is mostly AM anyways!

Sure it will do SSB! The BFO isn't adjustable, but the IF is wide as a
barn, wide enough that you can just set it on CW and then tune back and
forth until you get clear audio. Mind you it's unusable in a pileup...

Which was often the case for a lot of receivers. They had BFOs but weren't so great when SSB came along, or required you to turn back the RF gain a lot (so the BFO was strong compared to the incoming signal), which made it relatively insensitive.

They weren't good receivers, but neither were a lot of low end ones back then. But we bought them because we couldn't afford something better.

It wasn't a good choice, but a lot of people did start by shortwave listening, so they got a general coverage receiver. A ham band only receiver tended to be more expensive. So they had to live with a receiver that wasn't particularly great for the ham bands, until they could scrounge something better.

When I got my Hallicracter's S-120A in the summer of 1971, it was the cheapest I could get, and almost more than I could afford, using up all the birthday money saved in my relatively new bank account. It was junk, not just cheap like the S38, but solid state and thus made worse because the thing overloaded badly. But at the time, getting a ham license seemed some years in the future, since at the time you had to be 15 or older to get a license in Canada. So I bought that receiver, and never got much out of it. At least it wsa a time when there were lots of SW broadcast sttions, and I could thrill to WWV on six frequencies. And yes, it did "well" on CB, because there were local signals, and when the band opened up, it was wall to wall heterodynes.

It didn't do SSB, until I put a potentiometer between the antenna and the antenna terminals and reduced signals so the BFO was strong enough, leaving very few signals that were strong enough. But it wsa a period when there were some AM stations, I thought at the time they were younger and doing AM as "something new" but maybe not, maybe they just never switched to SSB. So I could listen to them every night on 80m and it was sort of what ham radio must have sounded like in earlier decades.

And then five months later, I read in the paper that the law was changing, so you didn't need to be fifteen to get a ham license in Canada.

I couldn't use that receiver for CW, not enough selectivity, so I was reduced to a record to learn the code. And then I was lucky, someone at the ham club when I finally found it lent me an SP-600 (I had it for about a decade), so I actually had a decent receiver. (It didn't do anything differently than the S-120A when it came to SSB either, except it was a much better receiver, much more sensitive and of course more selective, so when I turned down the RF gain to use the BFO properly, there were still plenty of SSB signals to receive.

Michael VE2BVW

Bought my FIRST S-38 from the base exchange at Amarillo AFB, Tx, in
1951.
It was small enough to fit under my bunk, behind my lined up (and shined)
shoes. I was

already a ham, but Uncle Sam had better things for me to do!

Don't remember when I parted with that little Honey, but the following year, 1952, in the barracks in Germany, I built Heathkit's AR-1 (or was it AR-2?). A crowd gathered when I first plugged it in. A little curl of smoke from a resistor had them all laughing, but then loud music erupted, and there were cheers!

Now, a couple of years later, I found a maybe 6 of 10, 6 tube S-38. I haven't got my new cardboard back or bottom yet, but knobs are perfect. Some Gentleman in the Midwest is selling capacitor (condensers, really) kits, which I have. (for three years)

Rome was not built in a day.

Old Chief Lynn, W7LTQ

Hi,

You're probably thinking of "Hayseed Hamfest":
http://www.hayseedhamfest.com/capacitors/Hallicrafters_1.html

I've only heard heard good things about him, but I'm not yet a customer.

73,
Ed Knobloch

Thanks, ED, I see he has a kit for my NC-183D! Glad you pointed out
his website. I had completely forgotten who that was. Got three kits
from him several years ago, and couldn't have been more pleased.

(No connection with him except purchases)

Old Chief Lynn, W7LTQ

I've gotten several can capacitors from Tom, excellent parts. These are brand new, not re-stuffed old cans and not old stock.

FWIW, the S-38B is essentially a five-tube wonder adapted to short wave. My first receiver was an S-38B which I still have. Its performance is certainly limited but it works well for what it is. It _will_ receive SSB with careful tuning and if the signal is not too strong. The RF gain is not adjustable. The S-38B and later versions uses a patented feedback arrangement for the BFO where the IF stage is made to oscillate. The BFO frequency is approximately centered on the IF frequency and is not adjustable.

The original S-38 used a different circuit with a separate BFO tube, it also had a noise limiter. Hallicrafters had a target price of around $50 but the rather rapid inflation of the time required re-design and simplification to maintain the price. National's competition was the SW-54. I've never had one so can't compare the two. The SW-54 used miniature tubes but the tubes in the S-38B were the latest octals so there might not have been any advantage. A lot of the performance would be determined by the quality of the coils and general construction. The SW-54 was also an AC/DC rig. Part of this was simply to save the cost of a power transformer but also some parts of some cities still had DC current supplied to homes and especially industrial areas.

My S-38B was a good friend for a long time.

The frequency stability of my HP3312A function generator is poor, very annoying for any practical use. I am trying to determine whether that behavior is fairly normal for function generators, or my particular unit has got a problem.

What is your experience on function generators frequency stability?

Thanks & 73

Most of them aren't terribly long-term stable, because they aren't designed for that. But with the HP, there will be a specification for drift in the back of the manual.

If you give it a half-hour warm-up, how much does it drift in the next half-hour?

How do you define "poor" stability? Scott is exactly right- units as the 3312 were not necessarily intended for long term stability. His suggestion of letting the unit warm up then checking is very good advice. Most test equipment is speced based upon a warm up period of usually 30 minutes. I had a couple of 3312s over 25 years ago in my design lab and they were fine for lots of the work we were doing. If you have a unit that is truly drifting badly over a short period of time after warm up then I'd say it has a problem. However, I don't know if you'll find a drift spec for that particular unit. Best I recall we (yes, I worked for HP/Agilent) didn't routinely spec drift on the low cost units until DDS came about. But one thing is sure- we were pretty much always better than anyone else with respect to most any specification you picked! Output jitter was especially bad on some competing units.

John

Most of them aren't terribly long-term stable, because they aren't designed for that. But with the HP, there will be a specification for drift in the back of the manual.

If you give it a half-hour warm-up, how much does it drift in the next half-hour?
--scott
--
"C'est un Nagra. C'est suisse, et tres, tres precis."

Unfortunately the HP manual does not tell the frequency stability. No useful information found searching the web.

Frequency measurement results:

- Just turned on. Frequency = 5.000 MHz Delta F = 0
- 15 minutes after. Delta F = -98 kHz
- 30 minutes after. Delta F = - 116 kHz
- 45 minutes after. Delta F = -132 kHz
- 60 minutes after. Delta F = -141 kHz
- 75 minutes after. Delta F = -147 kHz

Again the question is: is my generator faulty or all instruments based on the same (analog) frequency generation principle (charging a capacitor at constant current) behave more or less the same?

A function generator, by definition, is a generator that can put out multiple waveforms. They are also generally audio and low RF (ie hundreds of KHz) generators. They are great as a signal source when you need a triangle or square wave, not so great if you need a sinewave. And despite them running at "high frequencies" that doesn't mean they are the best choice for that.

I see it all the time (or used to) in sci.electronics. basics People would ask about why their 2206 or whatever function generator IC wasn't very good at the top of the range (whatever that was, 1 or 2MHz). The answer was obvious, it was the top of the range, pushing the limits of the device.

But they had no experience with RF, so they thought they could extend the nominally audio device to low radio frequencies.

Switch to something that is made for RF, and you immediately get better results, without any real effort. It's easy to build an LC oscillator at 1 or 2MHz, "way down there", but to stretch an RC oscillator to 1 or 2MHz, "way up there" is pushing things.

Get an RF mixer, and some crystal oscillators, and use that to mix the audio or low RF frequencies up to where you need them. Not perfect unless you can get rid of the image, but the function oscillator stays where it is stable, and you can use it as the variable element of the "oscillator", complete with sweep function (if the function generator has a sweep function) and multiple waveforms.

Tony,

I don't think there's anything wrong with your 3312. The numbers you've provided, however, don't actually mean a whole lot without specifying exact test conditions. Product specs are provided at a specific temperature(+/-), input power, etc. And, we've not even addressed the issue of the last calibration/service date of the unit. But, for the moment let's assume you are testing under the correct conditions and that the unit is in a calibrated state. After allowing for a 30 minute warm up (and it may actually need to be an hour) the frequency drifted less than one half percent over the next 30 minutes according to your numbers. Considering we're discussing a function generator that was designed in the early 70s using technology available at that time I'd say what you're experiencing is pretty damn good! Again, HP products were considered by the vast majority of those who knew what they were talking about :-) to be the best- the "standard". And the 3312 was an excellent, state-of-the-art, best-in-class product when it was introduced. But it's a function generator, not a high stability, low phase noise RF signal generator.

If you're looking for incredible frequency stability then you are using the wrong piece of equipment. Maybe you should consider a newer DDS unit, or probably more likely a true RF sig gen. If you're wanting a product with good spectral purity and lots of functionality then the 3312 is as good as you're going to find for products that are going on 40 years old as it is. And I bet it will even beat several products introduced way more recently.

John

That doesn't sound too bad. Sounds like you need to let it warm up for an hour if you care about stability.

>Again the question is: is my generator faulty or all instruments based on
>the same (analog) frequency generation principle (charging a capacitor at

You can get a signal generator with a precision oscillator which will be a lot more stable. But function generators are not designed to be highly stable or have very low distortion. They're designed to produce a wide variety of waveforms. You lose a lot with the ability to get that variety.

The HP is just great as a sweep generator for touching up IF strips,
but I wouldn't put a key on the output and put it on the air directly.
The distortion is really too high for that.

I think a drift of 24 KHz/hr after an hour's warmup is not terrible.

Hi all, I'm repairing an old Geloso G4/214 receiver.
I checked and subsituted (only the ones checking bad) capacitors, resistors and solid state diodes.
All tubes have been tested with an emission tube tester.
Potentiometers and switches have been cleaned.

The set appears to have been tweaked by someone else so the repair doesn't seem easy at a first glance.
However here're the symptoms, I think they are unrelated but I can't be very sure anyway.

1) no reception on any band, there's not the slightest crack or change of background noise even when touching the antenna connectors.
2) USB and LSB positions give a loud AC noise on the speaker but the AM position gives "normal" background hiss and not the slightest hint of AC noise.

Next step will be injecting a signal on the antenna socket and try to follow it through the various stages but I ask here anyway if these symptoms ring the experts a bell maybe.

Thanks in advance and best regards.

Frank IZ8DWF

My HP8116A has the same behaviour, to the point that frequency is specified with only 4 digits.
Normal for my unit anyway.

Hi all,
I am attempting to amplify a newly acquired multi elmac transmitter with a henry 2kw. The power of the elmac is too high and i have tried swamping it with a 50ohm dummy load in parallel with the amp. This helped but the input is still a little too high. Any suggestions? Is there a combination of resistors that can be used? Thanks. ND4jS. J

1: Google "Attenuator", or look in your ARRL Handbook. You don't want to just put a resistor in series or in parallel -- you want an L pad or (much better) a pi- or T-circuit attenuator. Note that you probably need a Honkin' Big Resistor or three -- whatever power reduction you achieve from the exciter to the amp has to get burnt up in the attenuator; it needs to be able to handle and dissipate the resulting heat.

2: Have you tried just turning down the drive (if you're operating SSB) or retuning for a lighter load (if you're operating CW)? Either one is easy to do, and doesn't require any equipment beyond what you have already.

Hi,

Assuming the linear requires 80W input to produce 1500W,
you need 20W carrier input to the linear in AM mode.
I would replace the 6146 with a 2E26 (same base pin-outs)
and lower the screen voltage in the exciter
for 20W carrier output. Then, no need for an attenuator
and the exciter will run cool. Monitor the ALC output
voltage from the linear and adjust your modulation
for just below a trace of ALC on voice peaks.

The final tuning and loading adjustment of the linear
should be at full modulated input, not with just the 20W
carrier and no modulation, or the linear will not
be set up for full output. If you don't have an audio
oscillator to drive the Elmac, you might want to use
an 80W CW input level from another exciter,
and note the tune and load settings of the linear
for max output. Then keep those settings with the Elmac
exciter as input to the linear.

73,
Ed Knobloch

Ummm   why not just lower the screen voltage on the existing 6146 ?

peter

Hi,

I think changing to a 2E26 instead of just cranking down the screen
voltage of the original 6146 for 20W output will result
in cleaner modulation. Starving the 6146 that much
for screen voltage may produce a varying load
to the modulator with plate (and screen) modulation applied.

Also, less risk of over-driving and possibly damaging

```
the tubes in the linear if the 2E26 is installed.
(A 2E26 costs about $4 new.)  Cheap insurance.

73,
Ed Knobloch

Frank,that is a nice looking receiver,,,It is double conversion..Two
6BE6 tubes in mixers.  your problem could be one of the oscillators
not running...If you have a scope or counter ,probe pin 1 on both 6BE6
's  should show a healthy osc signal on both..If no scope or counter,
you can use an auxillary receiver to tune to osc freqs,the   manual
may show these freqs..On this old stuff it`s good idea to test all
tubes ,make sure that they are good..Good Luck  73   Harold W4PQW

indeed it was, during the resistor check & replacement I had made a bad
solder join to the first mixer's LO input... soldering back that connection
solved pretty much all of the problems.
The receiver is however quite deaf by today's standards even after a full
realignment.

Yes I have some test equipment, I just started to scope around for signals
and found the missing first LO signal. It seems to me that the xtal
oscillators for the second conversion have a bit low signal output. Maybe
bad tube?

Thanks a lot

I have the Gonset Twins with power supply and all cabling. Problem: I however choose NOT to split them up. Please make me an offer on the package. Roland, WB6LNA (ex W2RPQ since 1954) 602-301-6660 anytime 24/7

I've stared at the underside and tried to follow wires buried deep in the tightly-bound wire bundles till my eyes are about to pop out. Can anyone direct me where to find resistor "R-63" which is 22 meg ohm? My receiver is very very weak, almost sounds dead although I can hear signals at a very low level and am thinking my AVC may be the culprit.

Can you turn off the AVC and get better results with manual gain? I
don't know if the TR-4 does it, but many radios just hook the S meter
into the AVC line, and many just control the AVC line with manual gain:
if the TR-4 does both of those, and if the S meter doesn't move when you
change the RF gain manually, then that would be a good indication that
something is messing you up.

And, if you can manually crank up the RF gain and get a nice loud signal,
then you know it's AVC!

Thanks for your thoughts Tim.

No, there's not means to switch the AVC off. The TR-4 has a scheme whereby signal is taken off an IF transformer and applied to an "AVC amplifier" that feeds it across a plate resistor that develops current which then varies the voltage to the grids of the preceding IF amplifiers and detector. As the voltage is varied, the output from their plates increases or decreases the gain, depending on whether the signal is stronger or weaker which provides the AVC control. The S-meter comes off of the same system. My S-meter will not adjust any lower than "S6" with the S-meter zero pot, so I am guessing that there is too much current being drawn somewhere resulting in too much grid bias which provides too much AVC action, which is the same thing that rotating the RF GAIN control down does.

My problem is that I hear almost no "receiver hiss" even with the volume control all the way up. I do hear signals, but they are very weak and rotating the IF and RF transformer trimmers has an effect on the amount of signal from my sig gen that I get. But the overall volume is way, way down.

In addition, if I inject a 9 MHz signal to the grid of the 1st IF transformer, I get lots of signal from the plate. But if I inject a signal to the grid of the 2nd IF transformer, the signal level from its plate is very low. Ordinarily that would mean the tube is defective, but it's not. I've swapped two NOS tubes (that all test well on a reliable professional tube tester).I've checked that IF amp's bypass caps and load resistors. Nothing.

So my focus is still on the AVC.

By the way, I was mistaken. What I thought was a "22 Meg" resistor is actually a 2.2 Meg. I thought the 22 meg figure was a little "out there" but until I compared my copy of the manual with another copy, I discovered the printing of the schematic was somewhat blurred causing the decimal point to be unseen. So finding the "missing 22 Meg resistor" isn't an issue anymore. Unfortunately, as it turns out, the 2.2 Meg resistor was within tolerance. That would have been just too easy.

I'd be much more apt to suspect the IF transformer (or the ceramic cap
used to peak it) rather than the tube. Still, I'd check plate and cathode
voltages on the tube to make sure they're realistic.

First of all I highly recommend you get the DVD for the TR-4 from Garrey www.k4oah.com   This has a lot of information not in the handbooks including photographs of the wiring. It also has the handbooks and schematics for all variations.

I doubt very much that its the AVC. But check the RF gain control to make sure its not turned way down, this is the little lever under the receiver volume control.

Another thing to check is the protection lamp. This is a pilot lamp in series with the antenna to prevent burn out from strong signals, remember the TR-4 was intended for mobile use. This is a small bi-post lamp in the compartment with the final tubes. If its open or if the socket has gotten corroded the antenna is effectively disconnected from the receiver. If the thing is dead on all bands this is a possibility.

There is also a switch on the left side near the back for Receiver or Transceiver. It can also become dirty. Just working it a few times will usually fix it.

Beyond that clean the band switches and make sure the tubes are tight in their sockets.

Tracing wiring is difficult because of the very compact construction. Check these obvious things first.

>are you happy with the way the radio works? Does it work as specified on both UHF and VHF?

As he didn't answer here, I'm guessing it was just a spam post, but I did buy an FD-880 and will give you my impressions of it.

It is a very solidly built radio, compact and with a great feel to it. It has 128 memories, but they are not divided into any banks, nor are any specific to either band. It's a little inconvenient, but I've programmed mine to alternate between VHF and UHF frequencies - ie, all odd number memory channels are VHF, while all the even number ones are programmed with UHF frequencies so I don't have to spin the dial too many times to access one or the other bands in memory if I had kept them all together. There is a programming cable and software available for it.

A number of people I have talked to on it are surprised at the sound quality as well as the signal strength. My FD-880 measures 5 watts on high power into a dummy load. The receive audio is outstanding. Clear and very loud when turned up just half way.
Programming takes a little getting used to, but isn't that the case with any radio? Anyway, once you've gotten used to it, it's a snap.
There are 2 features I don't have much use for, but I'll mention them anyway. That's the FM radio, (the 76 to 108 MHz broadcast variety) and stopwatch functions. The FM radio works, but that's about the best I can say for it. You can program 9 or 10 stations into their own memory locations to be recalled at any time. If you are listening to the radio, and a call comes over the VHF or UHF frequency set, the FM radio function will be interrupted so you can hear the programmed frequency.
The stopwatch - the best thing about the stopwatch is that it can be disabled in the menu! ;-) Using the stopwatch disables the transmit and receive functions.
This radio is well worth every penny paid for it, and I wouldn't hesitate to buy another.

Cons - yes, there are a few, but in my opinion, minor.
The "meter" bar shows full scale on any received signal - or more accurately, it is only an indication that the squelch is open, not of signal strength.
I read, (and have confirmed) that the DTMF tones are coupled to the transmit audio via the mic from the sound from the speaker. This means that if you have headphones on, the DTMF tones can not be transmitted because the mic can not hear them. Same holds true if you simply have the volume turned down all the way. It they don't come out of the speaker, the mic can not pick them up to transmit them.
The only way to charge the batteries is when they are attached to the radio. When you plug in the charger, it powers the radio up, even though the radio is turned off. It bypasses the on/off switch when charging, but seeing as the power switch is part of the volume control, at least it's turned all the way down when charging. The only sound you can hear is when the squelch, (for which there is no control except in the menu) opens and closes, it makes a click or pop sound from the speaker.
Weird, but I guess that's why it cost me less than $100.00 US even with a spare battery and shipping included.

That's all that comes to mind at the moment. I hope it helps. I really do like this radio. My HTX-204 is a better radio, but I grab the FD-880 when I go anywhere. That should tell you a lot.

Subscribe FREE to the K9YA Telegraph. It's Free, It's Fun, It's All
About Ham Radio.

The K9YA Telegraph is a free, monthly, general interest amateur radio
publication read by Hams in more than 100 countries. The K9YA Telegraph
contains the stories and features most wanted by our readers, because
it is written by them. An e-Zine, it is delivered monthly as a

full-color PDF file.

If you're in the mood for Morse, hankering for history, gluttonous for
gear, ravished for a review, needing nostalgia, or just plain famished
for fun, you'll find it in the K9YA Telegraph.

To check out sample issues, subscribe or write an article, visit the
K9YA Telegraph Web site.

```

If I wanted to buy a NEW 3.2 ohm speaker to use with a Hammarlund radio is there one that anyone would recommended for listening to AM broadcasts?
Is there any recommended size speaker such as 6 inch or 8 inch, etc?
Is there any loss in audio quality using a 4 ohm speaker?
How would two 8 ohm speaker in parallel work?

Is anyone using a DSP unit with their boatanchor which they would recommend?
Most [All ?] DSP units distort the audio so there is probably always some distortion, but some DSP units would be better than others. I am thinking in term of AM signals broadcast band reception.

I have followed the price of the Hammarlund speakers on ebay and they are a bit expensive. I assume they would be best, but a bit rich for me.

Thanks for any recommendations.

I would suggest you look at the Quam 8-inch full range speakers. The 8-ohm ones are fine.

The good news is that if you have a full-range speaker, the larger they get the lower the low end corner can be, because they can move more air. But the larger they get, the more high frequency breakup problems you have. The 8-inch drivers are very common since they are used in cheap distributed PA systems.

>Is there any loss in audio quality using a 4 ohm speaker?

No, because the speaker impedance is all over the place. In fact, I would suggest just using an 8-ohm driver and losing 3 dB of maximum level.

>How would two 8 ohm speaker in parallel work?

You'll get interference issues... you'll hear phasing differences when you move your head because you can't put the two speakers at exactly the same point in space. An 8-ohm speaker and an 8-ohm power resistor in parallel would be fine.

>Is anyone using a DSP unit with their boatanchor which they would recommend?
>Most [All ?] DSP units distort the audio so there is probably always some distortion, but some DSP units would be better than others. I am thinking in term of AM signals broadcast band reception.

You may look at some of the older JPS Communication DSP units. My guess is that for BC listening, the only really useful DSP feature aside from noise limiting is heterodyne elimination, and the JPS units were good at that.

I suspect that a 4-ohm speaker, or two 8-ohm speakers in parallel, will sound just fine.

I don't know what you want the DSP unit to do, or what you're calling "distortion", but just about any post-audio filtering unit is going to work by "distorting" the signal -- the question isn't "does it distort?", but "does it improve other things enough to make the distortion worthwhile?".

Beyond that -- I dunno, I really got on to answer your speaker question.

ttdesign.com

The noise I [most] want to eliminate is the HISS when you receive a
weaker signal.
The hetrodyne can also be a problem, but the slot can do some good,.
I got the Hammarlund because I wanted the full quality sound on AM.
I will have to except some distortion when I use a DSP unit.
The CLRSpkr DSP is a reasonable unit to use I think.
I would like to eliminate or decrease the fading effect by a better
AVC.
Well I cant have everything with a Hammarlund.Thanks to ALL for their
responses.
PS:: Is there a Service Bulletin to the HQ-145X ?

There isn't a lot out there to do that. There is stuff in the professional audio world for doing that, but it's either based on a desktop computer or it's expensive.

Most of these work by breaking the signal up into multiple frequency bands and gating them individually.

>The hetrodyne can also be a problem, but the slot can do some good,.

Slot?

>I got the Hammarlund because I wanted the full quality sound on AM.
>I will have to except some distortion when I use a DSP unit.
>The CLRSpkr DSP is a reasonable unit to use I think.

It's more designed for weak signal SSB work, but try it. In general, I find most of the gating systems sold for communications to be really unpleasant for long-term listening.

>I would like to eliminate or decrease the fading effect by a better
>AVC.

I think the problem is the ionosphere, not the AVC. You can make the AVC respond faster if you want, but then flutter becomes even more annoying. Anything that rides the signal is going to cause changes in the noise floor as it does so.

I have for sale a SB-610 that looks very much like the day it was created. It is refurbished Paul Kramer K0UYA. He is an expert in many areas, but he did an outstanding job on this project for. It was completed about a year ago and I never did get it hooked into my rig.

The SB-610 is $200 shipped to you. I have pictures for those that may be seriously interested. You will not find many 610's in this condition. It is a nice opportunity.

Does anyone have the specs for an Electro-Voice M-26/U microphone?
I bought one a while back and can't find any tech info on the E-V
site, which is generally pretty good.
It looks identical to the 630 series, but without an on-off switch,
and the nameplate is stamped 12,000 Ohms.
I'm guessing it's just a high impedance version of the 630.

Thanks & 73

That's a government issue microphone.  It could actually be one of many
different kinds of microphones... whatever met the standards for the
M-67 nomenclature and turned in the lowest bid that week.

If it looks like an olive drab 630, it probably is indeed a 630 but with
the reversed connector required by the JAN procurement folks, the paint
job, and possibly some additional sealing and waterproofing.

Could be a 630 element with a step-up transformer or it could be a
different voice coil.  I'd put a dollar on the step-up transformer.

Shure and University Sound also made mikes that met the AN/M-26/U spec,
which looked totally different.

Hi,
I have put together a short book on regenerative radio receivers to

mark the 100'th year of the discovery.
It is available here:
http://www.webstore.com/Regenerative-Radio-Receiver-Book,name,14754474,auction_id,auction_details
It explains all the main topics needed to make a regenerative receiver
work right first time.
Ok, It doesn't have a lot about tube/valve circuits that you guys are
interested in. Nevertheless some of the new semiconductor circuits I
present could be very effectively converted for tubes. Eg the
differential circuit.

FWIW I have a black and white tube set, a portable, with maybe a 17in
screen. It still works. Fact is, if I set that TV on channel 3 and
hooked it to my digital TV box, I could see over- the-air shows just
fine- and that would be pretty ironic, I suppose. I may try that later

next week, just for the heck of it. I rarely turn that set on, but
something triggered my irony detector. LOL!

Fellow Drake Enthusiasts,
The NEW R.L. Drake Virtual Museum is here http://www.drakemuseum.com . It's being launched page by page. You may follow my work at the new webiste.

The R.L. Drake Virtual Museum is under construction so there's not much there yet, but "stay tuned" ! Please observe that links in the menu is activated when the pages are ready to be presented.

The former R.L. Drake Virtual Museum http://www.dproducts.be/drake_museum/ has been closed.

Thanks to all the 450.000 vistors!

The main reason for closing it, is that my friend who I had the website together with, passed away last Christmas.

I have decided to build up a NEW Drake Virtual Museum from scratch. It will contain a lot of new pictures and info in addition to what were found in the former museum.

Welcome to The (NEW) R.L. Drake Virtual Museum www.drakemuseum.com

Sindre, LA6OP   sindtorp@online.no

Those blue plastic solid state late 70s scopes Heathkit (and made for Bell &
Howell schools) put out were the worst...Id part it out and cut your losses.
The only thing good about them were the flatface CRTs.
If you can find the manual for the 4555 look for the single trace model its
the same power supply.
Speaking of
I just had a fun day rebuilding a power supply and matching 6AW8 vertical PP
amplifier tubes for a DC coupled Paco S-55.....Good looking --but piece of
crap like my ex.

One of the worst pieces of junk made

>> Hi, I have an IO-4555 Heathkit O-Scope that started spewing out smoke
>> 15 seconds after turning it on.

Pull the cover, apply power. Look at where the smoke is coming out. If it's coming out of the power transformer, which it almost certainly is, pull the tubes and discard it. Nothing else is really worth saving, not even the switches and connectors.

If it's just a power supply cap failing, you may be in luck. But what mostly fails on those things are the high voltage secondary winding on the power transformer, which were very close to breaking down even when they were new. There are very narrow safety margins on those things. Everything in these scopes was designed to be cheap.

> Would like to find someone that can shoot me a PDF of the assembly
> manual with schematics. The operations manual would be nice also.
>
> I've checked Google and Dogpile for variations and can only find a
> schematic for the dual trace version. (IO-4550)

That should be sufficient since what is failing is almost certainly in the power supply anyway, which should be identical.

> A few places are selling the manuals for a goofy amount of money. I
> may have some files, templates, webspace, etc. that I can offer for
> trade.

Heath is still around and still selling manuals, and consequently they have been going after people who make them available for free since they are still in copyright. I'm okay with that, because they DO make them available at what would be a reasonable price for any piece of equipment that is worth something. The problem is that those scopes aren't really worth anything....

Wasn't it that Heath had sold off the old manuals to some guy, who having spent the money, became insistent that he reap the benefits.

There was a long period when those manuals were out there, nobody fussed, but it was after the new owner got control that things changed.

Michael

Hi,

The holder of the copyrights for Heath manuals is Don Peterson.
Here's his web site (he only deals in paper copies):
http://www.d8apro.com/

73,
Ed Knobloch

The older Yaesu`s like the FT-107M and others developed a readout
problem,,and ,no support from Yaesu after so many years..The radios
are rugged ,reliable and fun to use, no one wants to throw away an
old friend like this...not to worry ,,My friend in Japan JA2SVZ has
developed a kit to make the readout like new...His kit supplies a new

PIC and necessary parts to bring them back to life...Price is
reasonable, PO shipping is not bad ,he accepts paypal too which makes
it quick and easy.   and ,,he is just the greatest guy to work
with...A real Super Ham His name is Teruhiko Hayashi   look him up
with a google search or his email is ...thayashi@ta2.so.net.ne.jp Have
Fun..W4PQW   Harold

I was wondering if anyone might have an extra 455/3035 kHz IF
transformer laying around. I believe the part number is M26402-2.
It's used in the HQ-110 (some serial numbers), and I believe the
HQ-170/145.

Thanks,
Al, WA2S

Boatanchors,

So I bought a HQ129X at a hamfest last spring as a project. Seller had started a recap job & decided to quit and sell it - price was right for me. When I got the radio home I plugged it in - DOA. I found a bad power cord, spliced in a temp and fired it up - the loudest HUM I've ever heard - holy crap.

Anyways - I know how to use a soldering Iron but I'm in no way an electronics person - decided to see what I could do - I bought a recap kit for the receiver online and dived in this past weekend. Replaced the electrolytic can, then all of the paper caps except one - more on this one paper cap later.

I then replaced the power cord with a new 3-prong cord and fired the beast up.   No Hum (good). In fact the receiver works very well on MW and SW bands, quite sensitve and fairly selective - I was pleasantly suprized.

Anyways - back to that one paper cap - Any identification on rating is gone from the cap itself - so I donlt know what to replace it with? I supose I could just leave it but I noticed it gets very hot with radio operation - the ones I replaced do not - so I suppose it's bad and should be rerplaced? If I remove the cap the radio is dead - Perhaps somone familiar with these radios can help me identify the rating of this cap? It's of different physical size to the others I replaced. The cap is direct connected between one of the pins on the VR105-OC3 tube and the Relay connector on the back of the Chassis. I'm not a wiz with reading schematics - Even though I identifed the tube and relay in the schematic I was unable to discern the right cap in the diagram.... Can anyone figure out the ratings of this cap from my description of it's location and let me know?

Regards,

Gregory.

It MAY not be a capacitor at all, From your description, I would
suspect a wirewound power resistor which would get somewhat hot in
normal operation.

You will have to locate it on a schematic to be sure.

Al,

I don't have a spare transformer to offer, but are you aware that these 455/3035 kc transformers often fail but can be repaired fairly easily? The internal silver-clad mica capacitor tends to go bad. I've repaired one in a HQ-145 by replacing the internal mica sheet capacitor with a dipped silver mica across the transformer terminals on the underside of the chassis.

The same problem occurred to me with my Mosley CM-1. The mica capacitor was embedded in the transformer plastic structure, but paying a lot of care it was possible to remove it and replace it with an external capacitor.

The Charlotte conference is just 22 days away, if you haven't sent in your pre-registration yet you need to do so, it'll help us in having a idea how many are coming, if you want to take part in any of the 4 meals we'll be serving you have to pay for those by pre-registration and it'll save you $5 over the at the door registration fee.
You can go to the Antique Radio Charlotte web page at; http://antiqueradiocharlotte.homestead.com/index.html and download a printable pre-registration form, you can also down load the full conference brochure in PDF format that you can then view on your computer or print it out.

Things will start off early this year, the Tube Collectors Association is having a tube collector mini meet that starts at 9am on Thursday, this is open to everyone, you don't have to be a member.
As far as that goes you don't have to be a member of anything to attend the conference, BUT when you pay your registration fee you automatically become a member of the CC-AWA.
Also starting at 9am is something new this year, for the first time ever in the USA we'll be hosting the Charlotte International Cryptologic Symposium.
We have speakers coming from all over the world to give presentations and to display rare Crypto equipment.
It's going to be really hard to decide what to take part in...

We look forward to seeing you in just
22days 17hours and 51minutes.

If you have any questions, please let me know.

For my part, I'm sorry to be stuck here in Oklahoma in the middle of the spring storm-and-fire season, rather than there.

Please make people aware that I have a blog-and-image-upload site for such things, at <http://hamstuff.ath.cx>. I'm the owner, so I hereby declare that crypto gear falls in the "ham stuff" category. I'm also interested in rig pix and commentary, bugs/keys/sideswipers and other things that cause dits and dahs to be emitted, in images of oldies-but-goodies, and especially in images of Big Glass Tubes doing their thing and heating the room while they do it. If the plates happen to have color in the images, so much the better.

Encountered bad internal caps occasionally in ancient marine electronics.
Often, the bad cap was
nearly impossible to remove cleanly, so a "dirty" trick was to use a long
nose pliers to "crunch"
up the old one until it was history and then add the external replacement as
Tony and Joe described.

This thing is R-54, a power resistor, its supposed to run hot.

The HQ-129-X is an excellent receiver despite being an economy model.

There is a decent handbook on BAMA.

It was the post-WW-2 version of the HQ-120-X, which was the first receiver with the Hammarlund patented crystal filter. The model number comes from the originally intended price: $129, it didn't sell for that for very long and eventually the price about doubled.

The IF uses a combination of overcoupled transformers and critically coupled links to give a relatively flat bandpass and better skirt selectivity than is usual for receivers of this sort. Its main shortcoming is relatively poor RF selectivity (image rejection) from having only one RF stage, however the image rejection is still better than most receivers with a single RF due to the good design and high quality coils used.

Just like the Kenwood TS-820s. Take out the counter module and clean and
re-seat ALL the connectors !!!
If that don't work try the same thing with connectors in the IF circuit
All it takes is 1 oxidized connection to screw up things with counters, they require 4 inputs:
IF, VFO, Heterodyne and modulator, loss of any one of them will cause a problem

-Joe

I have a 545?, the one with plugins that was first sold about 1959,
someone found it as a hospital discard and gave it to me.

This was 20 years ago.  After a bit of use, I notice the trace is not
straight, clearly a bad filter capacitor in the power supply.  I actually
find it by using the scope to check itself, at one point the trace gets
even more non-straight, so that was the bad capacitor.  It was a fairly
large value for a high voltage electrolytic, I expected problems.  But
there at the local surplus store was the right capacitance and voltage.
And then the trace was back to normal.

    Michael  VE2BVW

So, clearly this is a boatanchor I should keep
(546 and three plugins *and* cart)!

The scopes that Tek made in the 1955-70 era were all-time classics,
particularly the 530-540 series and the later 422/453/454. The real

"go-to" guy on these is Stan Griffiths, W7NI, in Portland.
http://www.reprise.com/ash/clients2/home.asp
Stan's self-published book, "Oscilloscopes: Selecting and Restoring a Classic" is a must-have for the serious Tek collector.

Stan and I both went to work for Tek in 1960. My career with them was a bit shorter---three years in engineering, and two as an instructor in Field Training. What I know about high voltage problems on the 530-540 series fifty years later runs along these lines:

1. The original 531/535 and 541/545 (built through 1959) used "black beauty" caps in the HV filter. Those are the caps under the cover over the CRT socket. Replace them. The 533 and 543 were introduced in 1958 in a later configuration, and the "A" versions of all these don't have the black beauty problem.

2. The 5642 diodes don't fail all that often---if the filaments light and they are not gassy, they're probably OK. I believe there are solid state substitutes available.

3. The HV transformers in the 547 are a problem area, and need rewinding. There was a guy in Florida doing this in the 1990's; dunno if he's still around. Can't recall whether this affliction applies to the other 50 Mhz frames (544 and 546), but my recollection is that all three used the same CRT and HV setup.

4. On all of them, take the two covers off the HV compartments and clean them out. I do not use soap and water. Household ammonia on Q-tips and rags is all the moisture you want to get in there.

On any Tek scope, inspect the wiring under the lower chassis, looking for hardware that has fallen into the wiring. Tek used 6-32 screws and lockwasher PEM nuts in construction supposedly secured by Glyptol, but they come loose and fall into the wiring between ceramic strips.

When you first power one up, have a voltmeter on the heater supply, and make sure you've got 6.3 volts on power-on. If the heater circuit is shorted (hardware in the wiring), you'll cook the power transformer fairly quickly. So it's "on---check voltage---off" on first power-on.

About 20 years ago, I bought a few pickup-loads of these old Tek classics, and brought them back to life. What I kept for myself was a 533A with a new Tek CRT, a 575 mod 122 (reverse breakdown check), and a couple of little 310's. These actually do all I need these days. Also kept a full set of Tek test and calibration boxes that we actually used when the scopes were new.

Hank

Great info, Hank! Thanks! Hope mine is not the transformer.
I'll follow your advice about the ammonia.

73, David K3KY

On Monday evening I picked up a rather unusual item from my local vintage
radio equipment sale.
It is described as a MS64 Impeadance measuring set. Now I bought it for its
nice case and a very fine Velvet Vernier dial and also in the hope that it
was a multi band bridge for measuring RF impeadances (especially antennas).
However from the calibration sheet I found inside I'm now pretty certain that
it was designed for the old airfield low frequency beacons to set up the
antenna system. Although it is very well made and elaborate inside it
actually covers just 200 kHz to 550 Khz.
Oh well I guess it will make a nice basis for a better looking antenna
coupler for my station. Just goes to show that all your guesses can't always
be right!!!

Since you have not gotten a REAL answer, I will offer two suggestions:

http://www.piexx.com/ sells a replacement board for $59.

The page with the information is
http://www.piexx.com/index.php?main_page=product_info&cPath=8&products_id=26

You could also try http://www.willcoele.com/ which updates your existing board for $53, but this may not be an option since your board is damages.

I "loaned" my brother my 751 and he bought the Piexx board. He installed it in about 5 minutes and is good to go. Maybe he has the old one, but it would be quicker, and probably cheaper, to go with the Piexx.

Good luck, and 73.

Hey gang,

It's time once again for the annual HCRA Auction. Join over 100 buyers
and sellers for a great time and good bargains.

The details:

HCRA Auction
Feeding Hills Congregational Church
21 North Westfield Street
Feeding Hills, MA 01030

November 4, 2011

Setup: 6:00 PM
Auction starts: 7:00 PM

Contact person: Jim, KK1W - kk1w@charter.net, 413-237-4666

Free admission for both buyers and sellers.

Seller fee: 10%, $1 minimum fee as club donation.

Raffle Prize: Tickets on sale for a brand new Elecraft KX-3! No, we don�t have one yet, the drawing will be held as soon as one is available. Only 200 tickets will be sold, you�re chances are pretty high. Tickets are only $10.

Again this year � Venture Crew 510 (Crew DX) will be operating a food concession. The menu has not been announced yet but I�m sure it will be �delish�!

Buyers: Free admission for everyone, members and non-members alike. Bring a friend and have a great time!

Sellers: Please mark your items with your name, call (if you have one) and minimum acceptable bid (if you want to). Items without a minimum will sell for the highest bid. Computer monitors and printers should be left at home, they don't sell for any reasonable price. There is no disposal on site, if it doesn't sell you bring it home! The auctioneers reserve the right to combine small items into larger groups to expedite the auction experience. $1.00 or 10% of the sale is the selling fee.

Donations of items are always welcome. Do you have something so bad you would be embarrassed to put your call on it? Then donate it and we will get what we can with all of the proceeds going to help support this annual event.

More information on the club web site at http://www.hcra.org

See you there!

Jim, KK1W

Can someone compare the above receivers or direct me to a site that does?
I am interested in buying one of these and need to make a decision of which one
does what.
I did look up the reviews on eham. It was good but lacked a bit of comparitive
info.
Thanks

info.
> Thanks

Saw a few Hammarlund sites on the net...information seems available.

I had only one experience with a Hammarlund but I think the electronics leave alot to be desired. The physical contruction was par for the period, solid heavy case, etc. but the components were not very good. The tuning was rough and quality was lacking. Most of all, audio was very poor.

I would look at a National or Collins or Drake before I would ever look at another Hammarlund. The Nationals can be huge but the audio is absolutely beautiful.

A major difference is that the 170 and 180 have a third IF at 60 KHz.
This IF is tuned to 455 KHz, the second IF with a VFO. It has single
sideband with various bandwidths from .5Khz to 3 Khz. If I recall
it has a product detector.

The 170 is Ham Bands only, but it is prior to WARC.
The 180 is General Coverage.

The 145 is General Coverage. I remember its being a dual conversion
receiver with a crystal filter.

I've owned all three and think the 180A is the best of the lot. A common complaint is the narrow audio on AM but I call that "selectivity" (wink). Doesn't bother me because my top-end hearing response is somewhat damaged.

GL,
Bill, WX4A/KP4

With the "death" of shortwave broadcasting, the bands have gone from so crowded that nothing can separate the signals to enough spacing that wide AM selectivity is a good thing.

Still plenty to listen to, but you no longer need a sideband splitter (or synchronous AM detector) or narrow filters to hear it.

Geoff.

I had a 170 for a short while when I first upgraded from novice and loved
the clock but didn't much like the overall tuning. Lots of backlash,
and the dials were hard to read.

When I traded it for an R-388, it was a night and day improvement... stuff
I could barely head on the 170 was well above the noise floor.

I have a HQ-145XC(with the clock). It is single conversion under 10MC, then dual conversion above that. It has a crystal filter that works very well, the audio is OK. The HQ-180 is the "top of the line". If you can get one of those, then that would be the choice. The HQ-170 is Ham Band only, not general coverage.

There were several series of Hammarlund receivers. The "Superpro"
receivers were the top of the line and there were several models over
the years from the very first Hammarlund "Comet Pro", SP-10, SP-100
series, SP-200 series, SP-400 series and the final SP-600. The middle
of the line general coverage receivers had 6 positions on the band
switch and consisted of the models HQ-120, HQ-129X,HQ-140, HQ-150,
HQ160, and HQ-180. The cheaper receivers had 5 position band switches
and lesser quality parts. These models included the HQ-100, HQ-145,
HQ-200, and HQ-205(with CB xcvr built in).

The HQ-110 was a ham band version of the HQ-100 and was not of the same
quality as the HQ-170 (ham band version of the HQ-180).

From "73" for March 1963, where there's buying guide that is pages and pages long, likely quite extensive up to the time of publication.

HQ-145X Four bands (pretty normal for the time), full shortwave coverage from the bottom of the broadcast band to 30MHz. Double conversion above 10MHz (the SP-600 did the same thing). The X is supposed to denote a single channel crystal oscillator so you can have one crystal controlled channel. A crystal filter, which is bound to be a single crystal, with loading to allow for different bandwidths. A banddspread dial, sounds like an actual extra variable capacitor (unlike the SP-600 that just had an extra dial for finer calibration). The description mentions a notch filter, but that may be the crystal filter too. The HQ-145 came out in 1958 and variants ran at least until 1963 when this article was published. Apparently the C model had the clock. So the lettering in the model, unlike some manufacturers, is used to denote options rather than a slight modification of an earlier model.

On paper it has about what every general coverage receiver has, the double conversion above 10MHz definitely would make a difference though.

HQ-170
HQ-180

These sound like identical receivers, with the 170 being Ham band only (160 through 6meters, triple conversion for the 40meter band and up), the 180 being general coverage (540KHz to 30MHz, triple conversion above 7.8MHz with calibrated bandspread dial for the ham bands. Noteworthy is that it breaks into six bands which will be an improvement over average SW receivers of the time). The 170 came out in 1958, the 180 in 1961 and both still on sale in 63 when the feature was published. It says the 170 has 15 tubes, plus rectifier and regulator, the 180 has 16 plus the rectifier and regulator. IFs for both is 3035MHz, 455KHz and 60KHz. Both seem to have some sort of filter at 455KHz, and then better (and variable bandwidth) filter at 60KHz.

It's hard from the description to see how much of a difference there is between these two due to one being ham band and the other general coverage, and how much due to the general coverage coming after the ham band one and maybe getting some improvements. Both have product detectors, and it sounds like selectable sideband.

Clearly these last two are better than the first. The 170 and 180 clearly are much fancier design than the average shortwave or ham receiver of the era, especially when a lot of them didn't deal with SSB (so you had to turn down the RF gain, turn up the audio gain and sometimes fuss about).

Unless there's a big price difference, better to get the 170 or 180. Which one depends on what you want to do with it. A general coverage receiver can always be useful, and since the ham band one doesn't have the WARC bands (that came well after the receivers came out) the general coverage does get them. Back then, it made sense to get the ham band only, so you'd have a lot better dial for the ham bands, but nowadays most hams have transceivers already, so a general coverage receiver supplements that, rather than because it's cheap or dual purpose and then ending up being a bad choice as a ham receiver. If the 180 is as good for SSB as the 170 (which seems implied by these listings), the 180 is probably the better choice at this point, so long as the two are in equal shape.

The 170 does have the six meter band, which might be handy. When I had an SP-600, that did go up to 54MHz, I found it was good enough at the time for SSB at 6meters, though I had nothing to compare it to back then. It seemed stable enough, and because of the double conversion (a similar first IF frequency) image rejection was good; of course, that may not translate to Hammarlunds less expensive receivers.

Well, yes and no.  Even though the SWBC bands are nowhere near as
crowded as in the past all it takes is 'one' situation where Rcvr A's
ability supercedes Rcvr B and then you're sold :)

All three are good radios.  Gen Coverage vs ham band only coverage makes
the 170 an apple compared to the other two oranges in some respects.  I
used a 170 for a while for hamming but I fell upon a sweetheart deal on
a 180A and made the switch.   Although it didn't have that big vernier
knob like the 170 it was every bit as good - and maybe even better.  I
wound up liking the 180A better - in part because I do like to cruise
the spectrum and I didn't feel like I lost anything on the ham bands by
going with a GC receiver.

Scott mentioned dial backlash.  There must have been a problem with his
radio!  Its a direct drive and I can't imagine how you could get
backlash unless the 'disc' had worn spots.

I had a sensitivity problem with the 170A I had back in the 1970s. It
turned out to be a faulty regulator tube.  I replaced it and the
sensitivity returned.

It's been a long time and I don't remember if I felt backlash on my
Hammarlund but I do remember I didn't like the tuning. I think they used a
cheap (for the day) gang cap and it was probably too light. Direct drive or
not, a crappy tuning cap is going to give you bad feel and crappy tuning.

If you really want a Hammarlund at least see if you can try it out in person
or get a trial period. There are certainly better radios around.

My HQ-145XC has been re-capped and new tubes, and is smooth and a very
good AMBCB DX machine.  I rarely listen to SW anymore, not much to hear
like when I was in HS in the 60s.  I have always loved the look and the
quality of Hammarlund radios.  I had to start off with a crappy
Hallicrafter's S-120 from Sears.  I always wanted an HQ-180, still do!
What other radios do you think are better?

I used an HQ-170 for several years (a long time ago!) The vernier tuning (plus/minus 3 kcs, IIRC) was wonderful. Otherwise, based on later receivers, it was not that impressive. The internal "hiss" level was higher than many other receivers. (I worked 99% CW.) It had USB/LSB selectivity, but it was not great. There should be no backlash. Some functions, like the noise slot, were not very useful. Only later versions had 6 meter coverage; mine did not. The clock was nice, but it was just a clock.

HQ-170s are relatively cheap on ebay. (I bought one a few years ago, just for old-time memories, and sold it shortly thereafter. It does not measure up to more modern receivers.)

HQ-180s (in reasonable condition) are not cheap. For general shortwave listening, they are considered a high-end unit but this is a different category than serious ham usage (especially for chasing weak DX with minimal antennas, which was my HQ-170 experience).

As several people have mentioned, short-wave broadcasting is not was it was a few decades ago and is generally disappearing rapidly. You can still find the religious stations, if that is of interest.

I think your decision should depend on what you want to do with it. A good HQ-145X should be ample for general short wave listening, unless you have a very specific and difficult interest. An HQ-170 is ham-band only (without WARC and maybe without 6 meters). An HQ-180 may be better for more intense shortwave listening if you have specific objectives in mind. A good HQ-180 is likely to be much more expensive than the other two.

>

The HQ145 is one of the 'cheaper' Hammarlund radios. Unlike the
HQ120,129X,140,150,160,180 series it has only 4 bands (the others have
six for greater bandspread), a higher quality tuning capacitor (two rf
stages?) and higher quality parts thoughout.

What are the attributes that must be "part of better"?
Does sctvguy1 want just a receiver or will a transceiver do?
What modes does he really want to listen to, e.g., teletype, digital,
cw, ssb, am, fm? What frequency range is desirable? Would he want
VHF and UHF if he could get it? How about frequency setability?
How about a computer interface to the receiver? Does it have to have
knobs, or is a Software Defined Receiver ok? Is sensitiity more
important than selectivity? Must it look "pretty"?

Better is also a function of $. What kind of $ range is to be
considered.

Ed, N5EI

And I suspect at this point that "better" may not be the only criteria.

The H1-180 was about a decade old when I first read about it, coming into the hobby in 1972. It always seemed intriguing, something different about it, even though it wasn't the only receiver at the time it came out that dropped to 60KHz for selectivity with LC circuits (and thus supplying multiple bandwidths with less limitation of the phasing type crystal filter). So wanting it now might be because of that lust when it came out and was too expensive. There were lots of receivers that came out that had some neat thing about them, or others that were barely discussed, and yet they may take precedence over the "better receivers" because it's the unique that's desired, not "best reception".

Now, so many have transceivers (or a matched pair of receiver and transmitter), and if recent enough, they even have general coverage reception built in. So like I said, criteria is different now from even forty years ago, when you'd be trying to stretch a general coverage receiver to ham use. If you now have the function of general coverage, and generally good design, then the novelty of that Clegg receiver with the external converter so it covers the shortwave bands is much more appealing, whether or not there are "better receivers".

I'm not just talking about collecting, but that one can still lust after an old receiver without it being Top of the Line (though perhaps one lusts after those at the same time).

Hi,

I've got an HQ-170C. I'm surprised no one mentioned drift.
It's fine for cw/am, but SSB is a trial, unless you let it run 24/7.
The HQ-170C is the same as the HQ-170, except it includes
the optional clock.

My receiver required a realignment to get back the very sharp
selectivity designed into it. The audio system has a strange
design, where the level you set the gain control also affects
the audio bandwidth. If the audio is cranked up high,
for weak signal reception, audio bandwidth will be reduced.
It never bothered me, but it is something to be aware of.

The HQ-170AC added a separate, always-on filament transformer
for the HF oscillator and first mixer tubes, which must have helped
stability greatly. The HQ-170AC also solid-stated the power supply,

removing the 5U4 rectifier, a big source of heat.

The HQ-170A/VHF (last of the '170 line) added a built-in 2 meter converter designed by Frank C. Jones.

73,
Ed Knobloch

That's true, because while it's multiple conversion, the crystal oscillator is the second conversion (unlike the Collins sort of design, where it's a tuneable receiver with a crystal controlled converter ahead of it), so the receiver has the local oscillator is an LC oscillator running almost up to 30MHz or, the only difference from the average single conversion receiver of the era is that when it goes to triple conversion the LO is offset by 3MHz. Considering that stability was always an issue when the LO went up towards 30MHz with no synthesizer, the receiver can't be that different from the average receiver (except to the extent Hammarlund put into stabilizing the oscillator). As someone once pointed out, the Collins type arrangement wasn't just to get rid of image rejection, it allowed for a linear scale that was good for each band, and kept the LC LO at a reasonably low freqnency.

Is that the "variable response audio system" mentioned in the "73" listing? I read the listing as meaning "tone control".

>

I was going through more magazines last night, and noticed an ad for that one. It didn't mention Frank Jones, which seems odd since it does seem a selling point, his VHF book, all those converter articles (a new device would appear, like a nuvistor, the transistor, the FET) and he'd issue a set of articles, new converters for each of the 50 to 420MHz bands using the new device. When Tapetone, or was it Redline, came out with a new converter, they featured Sam Harris as a "proud owner".

Hi, Michael

No, there is no separate "tone control" with the HQ-170 receiver,
just the strange variable audio bandwidth circuit thru the AF gain pot.

There's a note on how to remove that HQ-170 "feature",
and add fixed negative feedback around the audio section

to reduce distortion, by Larry W9MDX, included here:

  http://bama.edebris.com/manuals/hammarlu/hq170notes/

If I recall the 170A had an audio based AVC. I suspect this provided
the appearance of variable selectivity based on volume.

I also recall that the way to avoid drifting was to provide constant filament voltage. If the regulator tube went bad, drift was inevitable.

I think I still have the HQ-170 "Brochure". I can put it on my website if people really want to see it.

Ed, N5EI

I don't think the ladder line will remain balanced next to that much coax.

I have about 100' 9913 coax running to remote homebrew Balanced-Balanced
(google that) tuner.
Tuner is outside in a plastic tub out in the woods, then feeds 4" open wire
line up a tree to about a 70' dipole up 25'.
Works great, 40 and up.

I was cleaning in my work shop this morning and I ran across a National Radio dial that I've had for many years. I've been meaning to get it out and see if anyone could use it in a National radio that their restoring.

I have no idea for sure what radio is goes on, it sorta reminds me of a Sky Buddy dial...

It is MINT original in the original box with the original national tissue wrapping paper.

You can see lots of close up photos of it here;
http://radioheaven.homestead.com/National-Dial.html

It can be yours for the nominal price of $20 plus Priority Mail postage.

I am interested in AM broadcast reception and not familiar with
Hallicrafters equipment.
Can someone compare the Hallicrafters General Coverage Receivers from
later 50's up.
How does the Hallicrafters receivers compare with the Hammarlund
[145/180] for clarity/selectivity/audio?

Thanks

Hard to compare without more specifics! Hammarlund HQ-180(A) gets beat
up in some circles for reduced AM quality audio. That's what you get
when you have good selectivity.

There's so many models from the era that you mention and so many other
features to compare. Hammarlund HQ-180A is going to be at the top of

most people's list.

So what changed since October 29th, when you were asking about specific
Hammarlund receivers, like you were about to buy one that week, and
couldn't decide which of the three models offered to you was the one to
buy?

"Subject: Hammarlund comprison HQ-145X, 170A, 180A

Can someone compare the above receivers or direct me to a site that does?
I am interested in buying one of these and need to make a decision of
which one does what. I did look up the reviews on eham. It was good but
lacked a bit of comparitive info."

There already was discussion about those three receivers here, yet you
never posted after your initial post, until you start another thread and
acting like you didn't ask the first time (and acting like nobody
responded the first time).

    Michael

I appreciated the feedback on the Hammarlund that I got with the other
post.
It has a lot of good usefull  information.
BEFORE I buy I wanted to check and see what was the thoughts on the
Hallicrafters receivers.
Always best to compare and get info on all considerations before you
make a decision.
The last post was specifically about the Hammarlund. This most is
mostly about the Hallicrafters.
All information and opinions are appreciated.
Hope that clarifies my second post.

-----------------------------------------------------------------
-----------------------------------------------------------------
I have a Hammarlund HQ-145XC, restored.  It is an excellent receiver,
dual conversion above 10MC, great for AM Broadcast Band DX.  Its crystal
filters give good selectivity and it is very sensitive.  Mine has the
optional clock.  I know that it was a "general coverage" receiver, but I
like it.  If you have the money, then go for an HQ-180, very expensive if
restored.

Well, just to let you know... the requirements for general listening to loud shortwave stations are kind of different than the requirements for picking flea-powered CW signals out of the mud. So you might want to have made that point before you asked anything in the first place.

Hallicrafters made a whole line of receivers that were basically consumer shortwave receivers. They weren't as well-constructed as top of the line radios, but the audio quality was very good and they were reasonably sensitive. In fact, the audio quality was better than that of the higher end communications receivers because they were designed for that.

You can find a Hallicrafters S-38 for $50 at a hamfest still, and they are fun and easy to rebuild. You would go absolutely insane trying to use it on 40M CW, but it's a good pick for shortwave listening.

Hey, just a minute, Scott! My old S-38 and I had a grand old time on
40M CW.
Crystal controlled 6L6 "tritet" and two crystals could work the world. Of
course one had to be able to copy the third or fourth one down in the pile.
S-38 wasn't
exactly a "single signal" set! That was in the early 1950's when 40CW was
just one howling, screaming mess after dark. Only in the early morning hours
was real DX possible....... the crowd had thinned a little and conditions
got
much better.

When wife and I turned to short-wave AM broadcast listening for a
while, we
found a "cherry" Hallicrafters SX-28A for $75 bucks that could really suck
'em
in! On standard broadcast band it was a marvel. The weaker ones suffered
from
a few "hetrodynes" (remember?) of course, but hey! that was state of the
art.
Today, I doubt if I could lift an SX-28A.

Old Chief Lynn, W7LTQ (since 1948)

So how do the newer or higher model SX models compare with the
SX-28A ?
I am unfamiliar with Hallicraftes Gen Cov receivers so any info is
appreciated,

So how do the newer or higher model SX models compare with the
SX-28A ?
I am unfamiliar with Hallicraftes Gen Cov receivers so any info is
appreciated,
Cadiscase

Operationally, I really don't know, but the newer ones were lighter!

I hope you understand the limitations of your questions. You are talking about OLD equipment. Chances are that anything you buy made needs some amount of restoration to make it work as it originally did when new. Most of the comments in the last week or two are related to comparison of the products when they were new. They are no longer new.

An old Hallicrafters S-85 (definitely not a high-end receiver) might out perform an HQ-180 (definitely high end) if the S-85 has been carefully restored and the HQ-180 needs help.

If you are looking at ebay and the seller says a receiver "works" then you do not have a clue about how well it works. It might be able to receive the AM station next door, but hear nothing else. It still "works".

Bill - W2WO

Hello all. I'm restoring an old radio, and in the process of replacing the assorted electrolytic caps, I came across a half melted looking wax coated cylindrical cap. The only markings on it are "Micamold 420E2503. On the next line, it says ".05 plus or minus 20 150". It's a tubular shape, not the usual postage stamp or lozenge shape that Micamold caps usually are. It's got a band on one end, so I'm guessing it's polarized - although the end without the band is grounded, the opposite of what I would have guessed. I'm guessing, .05MFD, 150 volts. I can't just look it up in the schematic, since this this part of the radio is a circuit a previous owner added on to support a Magic Eye tuning indicator tube. What do you think?

>

Why would it be polarized? People too often think there is some special reason for polarized capacitors, when in reality I can think of no application that would require a polarized capacitor. But, in order to fit larger capacitance into reasonable size, capacitors become polarized because they are made in a way that does cause them to be polarized.

One just looks at the value, and there's no way .05uF is large enough to require an electrolytic or tantalum capacitor. Thus it can't be polarized, there's no use in using them at that small capacitance.

What was common in the old days were capacitors where one side was best put to ground. Paper capacitors for instance, since it's a roll of foil interweaved with an insulator, one side will be more prone to stray pickup, so it should be grounded, and capacitors were marked to indicate which side. They will work in either direction, just that in one way it may pick up unwanted signals.

But that won't be relevant today, since capacitors of .05uF can easily be much smaller and with other materials, and there won't be a difference which way it gets put in.

    Michael

From your description it sounds like a wax paper capacitor. The band
is not for electrical polarity but denotes which end is connected to
the outer foil, which was often connected to ground, assuming the
circuit allows, since that would then act like a 'shield'.

You should replace all the wax paper caps too, not just electrolytics,
because they fall apart, as you have noticed with that one.

Btw, you can't trust that the 'brick rectangle' ones are always mica
either. Micamold was notorious for making paper caps in that shape
(say, around 500pF or so and up) but others did it too.

.05uF, 150V sounds right.

I agree. (And at 20% tolerance). And the 503 at the end of the other number
might be a forerunner of the notation now used, to mean 50,000pf so 0.05�F.

I have a Lafayette tube tester that works in a very simple manner: it connects all the tube elements, but the plate, to the cathode. It then measures the current flowing through the diode formed by the plate on the one hand and by all the other elements on the other hand. Very simple.

The tube tester has a potentiometer that permits to adjust the current meter sensitivity.

What is unclear to me is why ther tube tester manual instructs to set that potentiometer at position "30" (over a 100 scale) for almost all tubes. I would have expected that each tube requires a different setting (like in the I-177 tube tester), but it is not so: the magic "30" setting is valid for almost all tubes, big or small it does not seem to matter.

Can any one please help me to understand the reason for that?

Thanks and 73

Tony I0JX
Rome, Italy

Your Lafayette is a simple emission tester, which apparently assumes
that most tubes fall in a fairly narrow range of cathode emission
values. The I-177 is a mutual conductance tester whose chart has
settings that cover the wider range of gm values found in tubes

Right. The emission tester isn't testing the gain of the device or the
transconductance... all it is testing is how effective the cathode is
at emitting electrons.

How effective that is has to do with the surface area of the cathode, with
the temperature of the cathode, and with the composition of the cathode.
But you can be reasonably sure that most tubes of a same general technology
will have the same general emission. So if you pull some generic octal
tube or some generic miniature 9-pin tube, you can make a pretty good guess
what the emission is going to be.

Those testers are basically useless, though, since all they do is detect
one sort of tube failure, they can't detect any of the others. The ones
you used to see in supermarkets and drug stores tended to be calibrated
such that new tubes would test marginal, also, in an attempt to increase
sales...

That only worked until people started testing the new tubes before they
bought them.

Geoff.

Sounds like an ordinary old wax paper condenser, definitely not
polarized. What's its function in the circuit? Sounds like a real
home-brew mod, as if it is grounded, the band (outside foil) should
have gone to ground. An ordinary .05 mike mylar cap, 150 volts or higher,
is a replacement, if that value is suitable for the circuit function.

Hank

news:jalpbq$5s4$1@panix2.panix.com...

Right. The emission tester isn't testing the gain of the device or the transconductance... all it is testing is how effective the cathode is at emitting electrons.

How effective that is has to do with the surface area of the cathode, with the temperature of the cathode, and with the composition of the cathode. But you can be reasonably sure that most tubes of a same general technology will have the same general emission. So if you pull some generic octal tube or some generic miniature 9-pin tube, you can make a pretty good guess what the emission is going to be.

I am aware that the Lafayette tube tester only indicates one parameter, i.e. emission. As a matter of fact tubes showing almost the same emission on the Lafayette, instead show a very different performance on a professional tube tester (AVO).

But is still unclear to me how can a tube drawing a 0.3A filament current (e.g. a 6AU6) show the same emission of a tube having 2.5A current (on the Lafayette) .

An emission tester will give a good account of the condition of many
power tubes especially rectifiers. On small signal tubes a
transconductance tester is required to get a good idea of the tubes
performance.

> Old Chief Lynn
The SX28 was probably one of the best receivers that Hallicrafters ever
made (at least in the single conversion category).  It has two RF with
supercontrol AGC on the first RF and IF stages.  This receiver is built
like a Sherman tank (VERY HEAVY!).  It's also a real bitch to work on as
access to the front end coils requires extreme disassembly of much of
the front end to reach the parts needing work.  Alignment is also tricky
if you want to get it done right.  These receivers are much in demand
these days and good ones are in short supply.  A good one will cost!!!!
  The SX28 compares with the Superpro series or the HRO series in
classic radio lore.

Hi, Tony

I looked at the schematics of the Lafayette TE-50 and TE-36B
tube checkers found on line. They are somewhat unusual in that they
have no high voltage transformer.

The usual emissions tester (Triplett, Heath, Knight Kit, Eico, etc.)
uses about a 40VAC plate voltage transformer.
The Lafayette uses full line voltage through a 470 Ohm fixed resistor
in series with the 10K adjustable "Load" pot as the plate supply.
The autotransformer in the Lafayette is used merely
to select the heater voltage.

The usual emissions tester has a "Circuit" switch that selects
the current limiting resistor, and the "Load" resistor is merely
to adjust plate current meter sensitivity.

The Lafayette has no selectable fixed load resistor: the Lafayette
"Load" pot really +is+ a load resistor - if you set it to zero
during a Quality test you may damage the tube
due to excessive current, as the manual warns.

The Lafayette circuit looks more like a constant current source,
using a higher voltage plus a higher series resistance
than the standard tube checker.
If the tube works at all, you should get a "good" meter reading.

Very odd.

73,
Ed Knobloch

Not really. It was designed as a cheap tube tester for home use or the amateur TV/radio repair person.

If you consider that most failures of vaccuum tubes are caused by the heaters then a simple tapped transformer would do for the average guy fixing your TV in your home, or his collection of TV's or radios. Probably 6.3 volts alone would do for TV's and maybe a handful of other voltages for radios e.g. 5, 6.3, 12.6, 35, 50 and 70.

Any conductance out of the tube would be good enough to declare it "working".

Beyond that would require some skill in diagnosing failures, or a good tube tester which was beyond the means of an amateur "fixer" or junior tech, so the set would have to be hauled off to the shop for repair by someone with real skill and understanding.

In plain English, you could make a good living in the 1950's and 1960's carrying around a cheater cord, a similar tube tester and a suitcase full of replacement tubes.

You could make an arrangment with the local TV repairman with a real shop and real skills to fix the ones you could not and give you a reduced price if you brought it in, or a finders fee if he had to go out to it.

I made a fair amount of pocket money in the late 1960's just opening sets and looking for lit heaters. The ones that did not light up or were not warm went to the drugstore for their tube tester.

It's hard to imagine, but many people still had tube TV's and radios well into the 1980s. It's impossible to tell when US TV watchers got rid of the last of them, as they continued to work with over the air broadcasts until the digital switch, and the BBC ran a 405 line system until 1985, but I'm sure there were plenty of 625 line tube TV's around afterward.

Note that I am not talking about collectors, special purpose (e.g. ham/swl) radios etc. I'm talking about your average consumer who at least into the 1980's bought things because the old one wore out, not because the

90 day warranty expired. :-)

Geoff.

About three years ago, I completely restored a Heathkit HW-101 because
I was fascinated with 70's vintage SSB radios and that model seemed
the most approachable. I has lots of fun over the many hours I spent
with it, crafting techniques for doing the work, coming up with
low-impact mods for improving performance, and especially lighting it
up the first time and only having one little soldering issue before
the HF bands roared in.

Here is a sample of some of the things I did, just for the fun of it:

- one by one, I removed each PCB and cleaned it in a concoction that removed dust and wax. Sensitive components (coils,etc) were removed prior to the wash
- replaced EVERY SINGLE RESISTOR, and all polarized capacitors
- I moved the crystals on the sideband selection circuit to the other side of the PCB (got away from hot tube!) and added capacitors to tweak them back to the right frequency
- modulator diodes replaced with 4-way matched HP diodes
- Especially crazy, I replaced the filters with INRAD filters.

So, I finished it off, tested it, and put it on the shelf. I really don't operate much, and even then, prefer to use my Ten-Tec.
It is sitting around doing nothing.

I have had a similar thing happen with a H.H. Scott amplifier I restored. THAT one was really my masterpiece. After keeping it in my living room for a while, I sold it on eBay. Now, the thing with the HW-101 (and the H.H. Scott) is that they really don't sell for much. So, when I got about $150 for the amplifier, I wasn't surprised. What I was COMPLETELY surprised by was a letter I got weeks later from the buyer. To paraphrase, he loved the amplifier and felt the quality for the restoration was hardly justified by the money he paid for it, so he included a check for $150 more!

The additional money wasn't as great as the token of appreciation. I honestly got alot more out of that note than the $150. It was awesome and rare to get such a thing.

I'm am exchanging a radio for something with low value but still rare and awesome. What could this be?

Examples of Stuff Accepted:
A video of you playing a face-melting guitar solo
A spectacular lump of coal
A battery from the 1800's
Artwork of thine own hand
Some surplus thing that just looks awesome
Unusual clocks
Polished wood
An enormous nut - I mean freaking huge!
Backflips
A bottle of crude oil

Examples of Stuff Not Accepted:
Money (except if it is a really cool banknote)
Swaps for any common electronic equipment
Nothing
Meat Products

Of course, you'll want proof of the existence of this radio. In about a week I shall upload some videos of this to YouTube and add links to this post. This ad will be open for 3 weeks and the best suggestion will be chosen.

Good luck!

Hi,
I wonder if anyone knows anything about the above HF RX? Apparently
made, or re-badged, by a UK company in the early 1980s A friend of mine
has a friend (!) that has one and is looking for more info on it.

Those "drug store" tube testers had a gazillion different sockets
(mostly octal IIRC) to make them simpler for the average Joe to use.
Rather than having a bank of switches to connect the 4 test leads
(heater, heater, cathode, plate) to the various elements the tester just
had different sockets for each possible base connection. For a tube
that had multiple elements (IE: 6SN7GT) the tester either just put them
all in parallel or used TWO sockets and tested each half independently
They were emission testers and probably calibrated on the conservative

side to sell tubes. Still if you knew how to read them you could get a good idea of the actual condition of the bottle. If you held down the test button while the tube was warming up you got some more information.

If the tube suddenly jumped in emission or took a very long time to gradually reach a good reading (or very much higher than good), that could be a bad sign. Tapping the tube while watching the meter could show microphonics or shorts. The testers also had short and gas indicators, but I didn't put too much faith in them.

I have a Lakespur C-45 military radio. I have removed the 9 hex screws and would like to know how to remove the security screw.

What is the value of the C-45 untested?
Is it feasible to use it on the 24 and 28 Mhz bands?

I also have an AN/PRC-9A and am wondering about
the value of that untested and the feasibility of using
it.

Likewise and AN/PRC-64.

Thanks.

Barry,

You'll probably find what you need if you ask on the Clansman/Larkspur
Yahoo group,

groups.yahoo.com/group/clansman_larkspur

If you mean a Racal Larkspur set, I am not sure what you mean by the
security screw.  It should come right apart.

VMARS in the UK should have a complete set of manuals for those things and
there is also a Yahoo Manpack Radio mailing list where people often discuss
such things.  The Wireless No. 19 Set mailing list also has some of that.

>What is the value of the C-45 untested?

I don't know, I suspect it's not a whole lot because they made millions
of those things.  I suspect it also has a lot to do with whether the vibrator
supply is included.

>Is it feasible to use it on the 24 and 28 Mhz bands?

It's FM-only, which at least in the US means 10M is the lowest band you
can use it on.  Don't know about OZ.

>I also have an AN/PRC-9A and am wondering about
>the value of that untested and the feasibility of using
>it.

PRC-8/9/10 sets were also a glut on the surplus market as they got pulled
out of Vietnam and replaced with PRC-25s that actually worked well.  The
problem with those is that they need a strange B battery... some folks are
making replacements but they aren't cheap.  You should be able to find the
US Army TM for it on the web.

>Likewise and AN/PRC-64.

Now that actually might be worth something, although my guess is that it
would be hell to actually use on 80M.  Again, the Army TM is probably out
there somewhere, if not on the web or in BAMA, Fair Radio Sales might have
it.

It has ten screws on the front holding the case on. Nine fit
a standard hex key. One has no simple way to undo it.
Maybe I could grips.

>VMARS in the UK should have a complete set of manuals for those things and

I had a No. 19 set many years ago

That would explain why I got it cheap. I didn't get the power supply.

Hi, Myron

Here's the article:

https://rapidshare.com/files/1917089370/CQ_1957_01_-_Bedside_Rag_Chewer.pdf?bin=1

(If the address wraps around, just highlight the whole thing
before clicking on it.)

It looks pretty good, except I would use a power transformer
to avoid the shock hazard.

I checked the December 1957 CQ yearly index,
and there was no reference to any corrections
to this article, so it should be good to go.

73,
Ed Knobloch

Interesting minimal rig.  The voltage tripler supply looks a little
fishy, there should be three diodes in a tripler (the two in series
count as one), though he DOES have three capacitors.  I would use a
power supply with a conventional full wave rectifier myself.  I guess he
was limited for space.  Still the transformerless supply will be safe if
the chassis is grounded to a true earth ground and the hot side is
fused.  (Might have a bad hum problem though).

Hot chassis supplies were very common back in that era, and most consumer
television sets and radios continued to be hot chassis well into the
seventies.

My first transmitter was hot chassis, just a 6L6 with cathode keying
and a first-order bandpass on the output....

I recall an article about a 1KW 80 meter linear using 10 1625 tubes in
parallel (might have been 9 in parallel with one as a driver) with the
heaters wired in series and a voltage quadrupler power supply operating
off the AC mains (120v).

Oh, yeah! I started pulling 1625's out of command set transmitters to build that honey, but ended with push-pull VT-4C/211's from the spare tube kit that came with a complete BC-375.

Old Chief Lynn, W7LTQ

I've still got 3 or 4 that have seen severe service. First born require
long term high maintenance.

Old Chief Lynn, W7LTQ

```

Hi all,

I'm repairing an Geloso G.4/214 receiver of a friend. I first checked almost all the passive components (resistor, capacitor) for value tollerance and leakage and replaced the failed ones. Today I powered it up and started to check for other problems.
The receiver is quite deaf, a -40 dBm signal is barely audible on all bands.
AM and USB work but LSB seems not working.
First of all I wanted to follow the align procedures

as stated on "Bollettino Tecnico n.85". Now I confess I don't work very often with tube equipments, but the first phase of alignment requires to inject a signal to the "control grid" of V4 (6BE6, second converter). The 6BE6 datasheet mention a mixer grid (n. 1), screen grids (n.2 and 4) and mixer grid (n. 3). Looking at the schematic, I can see that as I'd expect, the screen grids are connected to a fixed voltage, the first grid (mixer) is connected to the xtal oscillators and this leaves the third grid which is connected with the output of the first converter (another 6BE6).
Now, what I don't understand is why I should inject a 467 KHz signal in a place where there should be a signal at the first IF frequency (around 4.6 MHz). I'd like an explanation about this and also any other hint in checking and aligning this receiver.
By the way, the resistor supplying anodic voltage to V3 (first converter) was burned and measured only 90 ohm instead of 2.2 kohm as per schematic. Does this necessarily mean I have a bad 6BE6 on V3?

Thanks in advance and best 73 de

Frank IZ8DWF

Hi Frank,

The reason that it suggests to inject the 467 KHz IF signal into the mixer grid is that the tube will serve as a capacitive coupling for the signal into the IF amplifier. If you try to inject at the mixer plate, you have to worry about the high voltage at that point. If you can hear an output with the signal injected into the mixer grid, the IF amplifier is working. Then you can inject the 4.6 MHz signal to see if the mixer is working. If the second mixer is working, move back to the grid of the first mixer with the 4.6 MHz signal. Etc. Etc. Of course, it would help to know what level of

signal at these points should cause a normal output. Good Luck and watch
out for those plate voltages. In fact, it is not a bad idea to check the
DC voltage on the control grids. If the voltage is positive, it might mean
a leaky coupling capactior.

thanks for all suggestions, I'll check the voltages on the grids first of all,
even if capacitors should be ok, all tests I made showed no leaks on them, but
I didn't test *all* of them as some are difficult to reach.
I haven't been able to find either a DC voltage chart or an RMS signal chart
for this receiver, so I guess it won't be an easy troubleshooting.

A better reason to inject the signal at the grid is that if you couple a signal generator to the plate, it will detune the IF transformer and prevent getting an accurate alignment. Using grid injection insures that the plate circuit is unchanged from the way it will be in normal operation.

The general rule is that connecting test equipment ALWAYS disturbs a circuit. You want to connect it in such a way that the disturbance can be ignored.

A burned out resistor could be the result of a bad tube but more likely would be caused by a shorted bypass capacitor. Since the resistor decreased in value, perhaps it applied enough current to the capacitor to cause it to burn open (metalized type capacitors are designed to do this), which is why you don't see a short now. It could also be the result of a loose wire touching something, a stray solder blob from a previous repair job, or anything like this.

Good luck,

Count on just about every stage amplifying, at least a bit. If you
inject a signal at the correct frequency someplace, it should come out
down stream, only bigger (assuming it's not so big that AGC is knocking
it down).

When I was a Novice, ca 1970, a local old-timer Ham loaned me
a Farnsworth Radio that was crystalled for the local 34/94
2 meter repeater.

The unit was a rack that was about 3 ft by 2 ft and had a
transmitter unit, a receiver unit, and a 60 Hz power supply
unit - all sitting side-by-side. Each unit could be removed
from the rack independently.

I recall the transmitter had an 829B in the final - the power
supply was full of mercury vapor tubes. The story was that
it was intended for use on trains. Either way it was
a 2 man lift.

I've searched several times for information on it but I've
never found any mention of Farnsworth VHF equipment.

Does anybody recognize this from my description?

Rob

The problem with most of that military gear is that it was made by dozens
of different companies on different contracts, so even though the unit you
had was a Farnsworth product doesn't mean that all of the other ones were.

That sounds a little bit like an ARC-4.

That's a Raytheon experimental number. I have a Raytheon document dated 1953 which lists a bunch of the QF numbers but not that one. These were never intended to be sold to the general public and so were not listed in the handbooks.

These are apt to be a variant of some relatively standard submini tube but without the original documentation or without a sample tube to put on the curve tracer I am not sure how we'd know precisely what it is a variant of.

Almost certainly your father bought a bunch of these from a surplus dealer. In the fifties and sixties there was a lot of wacky stuff coming loose from manufacturers like this.

>I am considering the possibility of donating these to someone but if

>cannot find out what they are for, I cannot imagine how I can find
>who
>to donate them to -- perhaps a school or something.

If you send me one I'll put it on the curve tracer and tell you more or less what it is. Submini tubes in general are not worth very much because the Raytheon plant was still making them well into the late 1980s and they're still coming out of the surplus pipeline even today. But they are still very, very cool and a lot of fun for small radio and audio projects.

Dear Scott;

Thanks for the great lead, I wrote to Hoyt and sent photogrphs of
the movement. I'll keep you posted.

There is only one "instrument repair" shop in my area, and they
won't touch a taught band meter movement, just replace. I guess
all the old craftsmen didn't survive Katrina.

Jim, WA5DXP

Among other applications sub-miniatures were used in hearing aids and model aircraft controllers.

I think indeed the first subminis that came out of the Raytheon plant
were intended for proximity fuses.  Those were designed with very heavy
reinforcement so they could handle heavy acceleration parallel to the
plate, and that same technology made them useful in a lot of other
low-microphonic applications.

Some of the last ones that came out of the plant were spares for the
first and second generation B-52 navigation systems, which used a
von Neumann machine made up of around 250 submini tubes.

In the meantime they went into everything from Army field radios to
weather balloons to condenser microphones.

They were just a hell of a great technology if you ask me.

Not just military stuff.  Those Motorola lunchbox type transceivers,
something like the P-33 (maybe that was a later model) used subminatures
in a hybrid.  There were some consumer radios that used them.  There was
even at least one military general coverage receiver that used them, I
can't remember the model but I remember the surplus ads, and it was quite
a fancy receiver (so likely the subminature tubes did make a difference
there, allowing it to fit into a somewhat reasonable space.

I think they were used in a couple of receivers made for the Navy by RCA. I remember seeing the solder-in tubes there. As Scott points out they were also used in some miniature microphones, for instance the Altec-Lansing M-20 system (I have one somewhere).

Check out their website. Heath is going back into the kit business.

HEATHKIT IS BACK In The Kit Business!

In late August, Heathkit will debut their new line of Do-it-Yourself kits for common around-the-house items. The first kit will be a Garage Parking Assistant (GPA). The Garage Parking assistant kit lets you build your own system that uses ultrasonic sound waves to locate your car as it enters the garage. The system signals to the driver using LED lights mounted on the wall when the car is detected and in the perfect spot for parking.

The GPA-100 kit consists of two primary assemblies - The LED Display in kit form and the pre-assembled ultrasonic range module. the kit will include everything you need to complete the project except a soldering iron and hand tools.

Next on the market will be a Wireless Swimming Pool Monitor kit followed by many more. Heathkit wants to continue to bring to its customers interesting, unique Heathkit products. Heathkit is interested in learning what types of products kit builders would like to build. Kit builders can submit their suggestions through this website using the Contact Us email.

I wonder if anyone can help me find info on a Marconi front end module that I picked up at the Flight Refuelling rally yesterday.

The module appears to consist of bandpass filters and RF stage, osc and mixer. There are four mechanically switched ranges using a wafer switch. The RF stage uses two UC734B FETs.

The module size is

75mm wide x 170mm high x 285mm.

I have put up some pics at:

www.radiowymsey.org/93.JPG

www.radiowymsey.org/95.JPG

www.radiowymsey.org/97.JPG

I'm pretty sure this is earlier than the Eddystone
made Marconi Marine EC958/5.

Any info greatly accepted as I think this could be the basis of a good home
brew RX.

Charlie.

I think that the first Raytheon subminiatures were from 1938-39 and made possible electronic amplifiers for hearing aids that could be worn in a man's suit. Beltone and Sonotone were producing amplifiers with these tubes that were about the size of a pack of cigarettes in 1940. The proximity fuse tubes were a ruggedized development of an already-mature product made in quantity for a ready civilian market.

I don't know when Raytheon last made subminiature tubes, but do know that they were going into new-manufacture missile warhead guidance electronics until the early-mid 1970's.

Sonotone did have their own line for subminiature tubes, but I don't know whether that was set up during WWII or afterward. Their first "transistorized" hearing aid hit the market in 1953, but it was a hybrid that still used tubes plus one transistor in a cigarette-pack amplifier.

Production line shut down in 1983, I think.  That factory now only makes
magnetrons and travelling wave tubes.

>Sonotone did have their own line for subminiature tubes, but I don't

The Japanese made the things too, and there were other companies like Hy-Vac
making them.

BUT... as far as the original poster's tube goes, I got a couple from him
in the mail and it looks to be a pentode with a 5J pinout.  My guess without
putting it on the curve tracer is that it is likely to be a CK531DX.  I'll
try and test it more carefully this weekend.

Hello Everyone,

I'm on the hunt for some vintage Tektronix test equipment (400-series and 500-series oscilloscopes, calibration equipment, etc.) Ideally, I'm looking for vacuum-tube and discrete-transistor based gear (prior to their newer IC-based stuff.)

I live in the Surrey, British Columbia (Canada) area and am willing to travel up to 300km. I don't have a lot of money to spend on this stuff,as it's a hobby, but will be more than happy to pay a fair price / fair market value.

I'm also interested in old vacuum-tube based HP frequency counters.

Thanks for your time -

Regards,

Chris

Does anyone have a ts-130s for sale?

Ok, the ts-130s may not qualify as a boatanchor since it doesn't even
have any tubes. But it's such a nice rig compared to the modern ones.
Simple yet complete, that's how I see it.

Thanks.

Daniel VE2BXJ

Robert,

I've seen these over here in the UK, although they were made by Mullard and had type numbers like EF731, 734, etc. I believe they were known for a while (at least in the UK) as "deaf-aid valves" as they were used in a body-worn amplifier for a ear-insert hearing aid. I came across them in a radio-navigation system made back in the early 60s where they were used for RF and IF stages up to about 3 MHz.

I am buidling a 1960 Electronics Illustrated Novice rig (see the
Files on the Ameco AC-1 Yahoo Group for more info on the rig).

I offer cash, trade, (I have a beautiful NOS 240-0-240 power xfmr and
other stuff), Rent with deposit to you or send you the front panel and
you make hole. (Postage paid both ways and a stipend!).

Oh almost forgot, I need 6L6 bottle or 6L6G, old style... and a 5Y3
and 5Y3G. I want to light up the whole room.

I am also still looking for a National Type "K" Vernier Dial.

73 All, John NS5Z

If you only need to make one hole, and it's an aluminum chassis, try using
a hole saw.  $5 at Ace Hardware.

I assume the 2" hole is for the panel meter.  I've used hole saws (works
best in a drill press) and they work fine.  Make sure you have good
belts on your drill press (mine are old and slip).  I've had good luck
with an el-cheapo hole saw set from Harbor Freight.

I'm restoring a Heathkit Seneca VHF-1 transmitter and am seeking the assembly instructions for the mechanical linkage between the band switch knob's shaft and the VFO module's band switch. Specifically, I want to know how to position the two shaft-mounted levers and the linkage that connects them. Can anyone please shed some light on this for me? Thanks.

I have a Hallicrafters HT-32B transmitter that I need to clear out.
Rather than just toss it, I'd love to see someone benefit from it.
The 5V xfrmr winding is shorted and there's a dented can, but
otherwise it should still be working (it worked when last fired up
years ago).

If anyone would like to restore this, or needs any parts from it,
please let me know asap.

73,
   Rob, KA1ARB

Question about using 450 ohm "open wire" twin lead....

My shack is located off the garage toward the front of the house. I can't run any feed line through the window or walls as these face the front and sides of the house visible from the street. In order to meet XYL approval we installed a 1.5" ID plastic electrical pipe in the wall that gives access to the attic crawlway when we built the add on room. Right now I have a single RG8/u coax cable running through the pipe in the attic to my vertical. (The coax leaves the attic via a hole drilled in the roof under-hang).

I'd like to put up a multi-band dipole feed with open wire line (actually the 450 ohm web spaced twin lead type). I know that this type of transmission line should be run in the clear if possible.
I can run it to the attic via the feed pipe, but it will be parallel with the coax for the 10-15' length of the pipe. I can then run the twin lead though the attic attached to rafters until I reach a turbine

attic vent and pass the cable out of the roof via a hole drilled in the
turbine base. The hole would be lined with plastic electrical fittings.

Will this scheme work, or will the feed line be too negatively affected
by the surroundings to work with a tuner in the shack? We are not
talking about extreme QRO power, the largest amplifier I have in mind
would be about 350 watts out max, and usually I would run the IC-746
barefoot at 100 watts out.

I wouldn't do it that way. Voltages can get pretty high on tuned open wire.

I would run coax until I was outside and have a remote antenna tuner to
feed the antenna.

No, you need it to be clear some distance away from the feedline. You
cannot put it in the same conduit with coax. You could possibly put it
into a 1.5" plastic pipe all by itself as long as the pipe was clear
and didn't have any nails or anything within a few inches of the pipe.

>Will this scheme work, or will the feed line be too negatively affected

It doesn't matter how much power you're running, or even if you are just
receiving. If the feedline becomes leaky, it becomes part of the antenna
and the antenna pattern is disturbed. If there is anything conductive near
the feedline, it will become leaky.

If you want to run a transmitter with a 450 ohm output, I would balun it
down to coax and use the existing coax.

If you absolutely have to run some kind of balanced transmission line
through a conduit, consider IBM Twinax.

Ok, its more of a dinghy anchor than a boatanchor but I know the
schematic is difficult to find. I finally got a copy and have posted it
for others who may need it.

I was told I could use parallel runs of coax with the shields connected
to each other (and nothing else). 93 ohm coax would be best if I can
find some!

A remote tuner is an option and there was an article in QST this month
on building one. But the differential cap (in a "T" network) and roller
coil driven by motors seems a bit "Rube Goldberg" to me. I'm also not
too sure how to build an end of limit switch for the coil.
(you don't want to leave that out!!!).

That gives you something like 150 ohms for RG-11, or 200 ohms for the 93 ohm stuff (which your Belden rep can sell you). Not 450 ohms. Whether this is a problem or not depends on your antenna system.

>A remote tuner is an option and there was an article in QST this month

How does a remote tuner help you? You still have to run a 50 ohm feedline and then transform to 450 ohms at the transmitter.

What's wrong with having a local tuner at the radio? I mean, besides the feedline losses.

Nothing wrong with a tuner at the rig. The issue is running 450 ohm
twin lead (nothing magic about that impedance, just what is available in
a "open wire" balanced transmission line with low lose that will fit

though a 1.5" plastic pipe) from the shack to the attic next to coax cable. I can't run the feed line "in the clear" which makes for more loss. Putting the tuner in the attic allows running coax to the tuner and the balance line to the antenna, the run from that point on is 'cleaner'.

I need to find the internal ram board for an Icom 745/751. I broke
mine by pushing too hard when reinstalling.

Money is tight, as we all know. Do you have one that I can buy?

I sure would appreciate it.

Thank you.

I'm not sure that the 745 is a boatanchor... but have you considered epoxy
and tack-soldering hookup wire jumpers across the break?

Thanks for the reply, Scott.  There is hardly a circuit board made
that I won't attempt to repair.  However, this one is cracked in so
many places, under chips, front and back that it is crazy to try it.
However, if I don't get a replacement, I am crazy enough to try it as
a very, very last resort.

I wouldn't even mind too greatly to make my own pcb.

Take care.On 30 Sep 2011 09:40:56 -0400, kludge@panix.com (Scott

When it comes to the Air Force 1 {1}{/1}a lot of you might imagine

```
that it would be quite hard to continue improving and innovating on
the design of it, but leave it to Nike to surprise you at just about
every turn. Those of you that know Nike=92s reputation know that they
always have new tricks hidden up their sleeves to keep t=85
We well know that the Nike Air Force 1{2}{/2} is one of the most
versatile models that we have seen hosting a custom program called the
Nike Bespoke. Since the last pair of Nike Harajuku customs plus a
couple more designs done by different individuals, the AF1 has been
off the scene. Yet no worries because it is   http://www.jordanshoesoutletn=
et.com/

I wish you lived a little closer, Chris. I have a Tek 546 scope
(50MHz) with the original cart, original manual, and a 1A1 and
a couple of 1A2 plugins. BTW the scope had developed HV problems
and would lose the trace within about a minute after turnon.
I understand that was a fairly simple problem to fix, however.
I also have original manuals for the plugins.

Most HV problems on those scopes can be solved by scrubbing the thing out
with soap and water and letting it dry thoroughly.

Occasionally you'll see HV rectifier problems and bad ceramic caps, but
leakage from built-up dirt is the number one problem.

Our local surplus dealer in Tidewater, VA just pulls the tubes out of
those things and dumpsters them; he says they aren't worth the money
to drag them out to hamfests and nobody wants them any more.

I actually have a 545 on my bench at work, although the cal guys hate me
and they keep trying to replace it with an Agilent DSO. It just runs
and runs, and it's easier to cal than they claim.

Thanks, Scott!

Great info. I had heard these were supposed to be fairly easy to fix
with that sort of problem. Your very specific suggestions are enough
to motivate me to take a second look at my beloved old boatanchor.
So I will as soon as I can get to it, and I'll stop back here and
let you know how it went.

The good news is that, unlike cheap Heathkits, they don't blow up their
power transformers often at all.  Everything except the CRT and the power
transformer is readily replaced.

Hi,

Here's a manual for the Drake SW-4A:

https://rapidshare.com/files/786287506/Drake_SW-4A_Shortwave_Receiver_WW.pdf

73,
Ed Knobloch

You're doing better than I am. My ISP's server and eternal-september
have nothing later than June 13.

This seems to be the only problem group of all to which I'm subscribed.
  The Radio, TV, phono group is alive and well.  Any of them, with the
exception of the sewer that rec.radio.amateur.policy has become, are
placid compared with the politics group.

73,

Dave K8MN

Thanks for coming out of the woodwork to make a snide comment, Eddi.  If
you were paying attention, you'll note that I began a thread called "No
posts..."  Therefore, I set the topic.

Eddi,

You're obnoxious.  There haven't been ANY topics in this newsgroup for
days.

Hi,

You might try improving the grounding of the final plate tune capacitor,
to elliminate an rf feedback path, as pointed out by Tom Rauch, W8JI:

http://www.w8ji.com/johnson_vfo_chirp_jump.htm

Tom is the designer of various amps in the Ameritron line.

73,
Ed Knobloch

Oh yes, Eddi, you are.

I'm happy to throw that in.  You're obnoxious and a nitpicker.

> Still, the absence of posts in rrab is not a valid topic in rrab.

Yes, Eddi, it assuredly is, whether you like it or not.

I have a thought for you, Eddi:   If you hadn't been obnoxious, I may
have offered you some advice on the Ranger.

St. Athanasius says,
"Most individuals who hear the word =91Saint=92 cannot or do not realize the Greatness of this word, because in the humanistic way of thinking, most things are thought about materialistically, monetarily, and for the closeness to be with other human beings; in fact, it is true that the real treasure of human life is only thought in an air of instruction, not evaluating the Greatness that it truly is, and that is to become a Saint, to one day be in the Presence of The Creator of All Things."

REVELATION DELIVERED THROUGH FRANCES M. KLUG
ON JULY 19,2003 AT 1:45 P.M.

SAINT ATHANASIUS

=93I am Saint Athanasius. As I speak today, I speak with deep love for the Gift of The Father=92s Love in which He has and is allowing so many of Us Here to put into Words, Directions, Hope, and Divine Love for the Souls of millions of human beings. Even though it does not, or I should say, is not recorded, there are hundreds, perhaps even thousands of individuals of all ages learning more about what a Beautiful Gift human life is, because of The Father=92s Love for it and the Goal that awaits it at a specific time.

So many of Us Saints thank The Father each time He allows Words to be spoken that will help men, women and children to more fully understand that human life is not only in His Divine Plan, but He has a Special Love for it because He has placed within it a Portion of Himself to give it strength to do what The Father Wills for them, to become Saints.

Most individuals who hear the word =91Saint=92 cannot or do not realize the Greatness of this word, because in the humanistic way of thinking, most things are thought about materialistically, monetarily, and for the closeness to be with other human beings; in fact, it is true that the real treasure of human life is only thought in an air of instruction, not evaluating the Greatness that it truly is, and that is to become a Saint, to one day be in the Presence of The Creator of All Things.

As I close My Words at this time, I must add one Statement: The Father shows His Love of human life through allowing so much to be instructed regarding His Closeness to human life, His Reason for creating it, and that the Goal that awaits the Soul, with Him at a special time.

Needless to say, All of the Saints Here in the Heavens not only enjoy speaking these Words, but We thank The Father for His Divine Love in wanting to share What He Is, Who He Is, with those of Us Who once were human beings.=94

Hi all,

I have six pairs of heavy-duty full extension slides for rack mount
equipment that I'll be happy to find a new home for, for the cost of
shipping, or pick up in the N. Seattle area. They are 25" long,
1-3/4" wide, 1/2" thick with three 1/4" thick steel blocks welded to
the moving slide for a net 3/4" thickness. AFAIK, they were
originally designed for HP test equipment in a rack.

Care to save them from the scrap metal recycle?

Cheers,
Tom

Hi, Eddi

Nice to hear from you, as well.

Here's a source for 1/4" diameter PTFE rods:

http://www.smallparts.com/small-parts-ptfe-round-white/dp/B003SLEZIG/ref=sr_1_5?sr=1-5&qid=1309915938

Wow, a real saint in heaven, who knows so much, yet is absolutely
unsure of even basic facts like whether there are hundreds or
thousands involved.

This maudling invented trivia would be ok if it were confined to
appropraite news groups, and not subjected to the critical eye of
people here who can see it for what it is.

<remainder of crud cut>

Please do not continue to post off topic material, thanks.

peter

I have a Heathkit SB-401 transmitter I refurbished a few years back that exhibits a couple of peculiarities during tune-up:

1) First, on 80 meters (and only 80 meters) when I tune the final amp=92s plate circuit, the plate current dip point does not correspond to maximum output.

2) Second, I never read any grid current during tune-up. However, the manual states that I could see as much as 0.5 mA during tune-up.

I=92ve check the components in the final amp, to the extent I can without un-soldering anything, and found no problems. So I=92m wondering if I have flaky tubes in the final that can=92t be neutralized (problem 1) and draw negligible grid current (problem 2). The tubes are 6146s and one slightly glows blue during key-down in CW.

This really isn=92t problem--just a nag. I monitor my on-air signal with an SB-610 monitor scope and the output looks fine.

A pale blue glow can be a normal ionization glow, doesn't mean gas.
The tank circuit on most rigs for 80 meters tends to be low Q which
means it will tune broadly. If the the plate current dip and max power
output doesn't match it could mean a miss-match between your antenna and
the rig, IE: high SWR. The tank circuit on the '401 is designed to
match between a 50 ohm load, stray too far from that and the tank
doesn't tune correctly, 80 meters is the worst in this regard due to the
limited range of the variable caps on that band.

No grid current? check your bias setting, driver tube OK?

text -

The maximum-output-not-at-plate-current-dip problem occurs when I use
my 50 Ohm dummy load.

Incidentally, the 401 is specified for output (antenna) loads between
50 and 75 Ohms. I suspect this is why the LOAD control has little
effect on the tuning.

Honestly, it's the no-grid-current problem that has me more puzzled.
I've checked the grid meter circuit and found the resistors to be OK.
Just for kicks, I may open up the 401 and check the them again. The
meter works fine for other measurements (plate current, peak output
voltage, etc.), so I don't think it's the problem.

The blue glow on the glass is from electrons striking the glass. That is not a problem. If the glow is inside the plate (between the plate and grid) that is gas.

In my experience, the tuning problem is from not completely neutralizing the amplifier.

hello,everyone
I have an R15 and a R19 ,those very nice small vhf receivers,they both work
,with their dynamotors.All I had to do was to build a small 24v dc power
supply and a dipole ,and clean a hs30 and I listen to the planes around
me.There is an airport 30km from my home .I am looking for 'litt�rature'
about them,I was unable to find.Can I have links please?
thanks very much ,73

Alain,

Did you try a search on "ARC-5"? There are manuals for this series on
line but I am not sure if they cover the VHF models.

hello,thanks for your answer ,unfortunately this manual ,found on edebris,is
only for the the lf and sw
parts,I found a manual for the vhf tx and rx but it is for
the r28 (xtal controlled),not my rx that have vfo and receive all the vhf
band .Unfortunately they do not have a dial.I have them since 15 years at
last ,they are very sensitive receivers: I remember that one day I received
with one of them a nooa satellite on 137mhz and even made a picture.I only
have their schematic,nothing else.
In fact there is nothing exotic in them but for me,it is always pleasant to
look at those manuals.

```
thanks and 73

Q1) First, on 80 meters (and only 80 meters) when I tune the final amp�s plate circuit, the plate current dip point does not correspond to maximum output.

R1) If this problem only occurs on 80 meters it means that, although the tubes are correctly neutralized, some particular effect occurs just on 80 meters which alters the zeroing of the neutralization bridge on that band.

The most likely cause could be a bypass capacitor having too low a capacity (the reactance of a capacitor decreases with frequency). For instance, your screen bypass capacitor may result to have enough capaciity for the 10-40 meters needs, but not enough capacity for 80 meters. If so, neutralization on that band would be upset. The same could occur due to a too low capacity cathode bypass capacitor.

A possibility could be that one bypass capacitor has got "open" (at those times it was not uncommon to put several bypass capacitors in parallel, so that, if one capacitor gets open, the total bypass capacity decreases).

So, the simplest thing to do is to try putting a bypass capacitor (say 0.01 uF with appropriate voltage rating) in parallel with the existing one, on both the final tubes cathode and screen, and see what happens.

Q2) Second, I never read any grid current during tune-up. However, the manual states that I could see as much as 0.5 mA during tune-up.

I�ve check the components in the final amp, to the extent I can without un-soldering anything, and found no problems. So I�m wondering if I have flaky tubes in the final that can�t be neutralized (problem 1) and draw negligible grid current (problem 2). The tubes are 6146s and one slightly glows blue during key-down in CW.

R2) Having no grid current is usually due to the fact that the driver tube does not deliver enough drive power into the final tubes grid. Although this could possibly be due to a weak driver tube, the most likely cause is that the driver stage (or the stages before that) are not well adjusted. You could then try performing the adjustment procedure described in the manual.

In any case, having no grid current does not cause any problem. Probably you now get a somewhat lower RF output power than if the final tubes grid would be driven harder.

Tony,

Thank you! I'll try your suggestion of placing additional caps in parallel with the existing bypass caps.

Incidentally, I found a spare set of 6146 tubs, installed them in the SB-401 and tuned-up on 80 meters. Even though I didn't neutralize the tubes, the '401 exhibited the same behavior I described above. This suggests the problem is not with the tubes, but with some other component.

Yeah, come to think of it, little or no grid current isn't anything much to worry about. The 6146s are pentodes. Their grids shouldn't draw much power, in any. I think the narrative in the manual is misleading.

Tony,

Thank you! I'll try your suggestion of placing additional caps in parallel with the existing bypass caps.

Incidentally, I found a spare set of 6146 tubs, installed them in the SB-401 and tuned-up on 80 meters. Even though I didn't neutralize the tubes, the '401 exhibited the same behavior I described above. This suggests the problem is not with the tubes, but with some other component.

Yeah, come to think of it, little or no grid current isn't anything much to worry about. The 6146s are pentodes. Their grids shouldn't draw much power, in any. I think the narrative in the manual is misleading.

-Dave, K3WQ

Hi Dave

when you'll have done the test, please let me now as I am curious to know whether the extra capacitor helps.

The screen capacitor is the most critical one because, if the screen does well shield the plate from the grid, the neutralization bridge gets obviously altered.

Yes, there should not be much grid current. Anyway, if you get the RF output power you are supposed to get, you may forget that grid current issue and you would be all set.

If the problem is ONLY on 80 meters then the issue may be with the output loading capacitor. On 80 meters the three gang variable loading capacitor isn't big enough so the band switch adds an additional fixed cap in parallel. Maybe that cap has gone bad or the switch is not making contact on that band. Try putting a 500pf 500v cap in parallel with the output loading capacitor and try it on 80 meters.

Should the output Pi network capacitance be too low (bad additional fixed capacitor or faulty switch), one would just see a dull plate current dip and get low RF output power, due to the Pi network overcoupling to the antenna. I see no reason why it should also cause the final stage to become non properly neutralized (as evident from the fact that the plate curent dip does not occur as the same plate capacitor setting as for maximum output power)

I find it hard to imagine that the final could exhibit symptoms of being out of neutralization on 80 meters. The grid / plate capacitance is simply too low to cause feedback on this band.

The Heath SB series used an unusual pre-selector / driver tuning circuit. On 80 meters a single coil with a coupling link is used in the tank circuit on both the input and output of the driver. It is tuned by variable capacitor, and tracking is adjusted with a variable powered iron slug. On the other bands additional slug tuned inductors are switched in parallel with the 80 meter inductor. These inductors are connected in series and are shorted out one by one between 40 to 10 meters by the band switch. On 80 they are disconnected from the circuit. IF the 80 meter inductor were open the circuit would not tune correctly on that band, but the series connected inductors might still resonate close enough on the the other bands, on 10 meters the open 80 meter inductor would not even be noticed. Since this circuit is part of the neutralization bridge it would be worth checking.

My answer applied to your suggestion to check the fixed capacitor(s) in parallel to the Pi-network loading capacitor.

As to the other issue you have raised, it is not easy for me to fully appreciate - without actually looking at the diagram - whether an open inductor could really yield some change in the neutralization bridge, and not just a loss of drive signal, but it could well be.

Anyway, it now comes to my mind that also the capacitor byassing (though not completely) the cold side of that inductor to ground could be responsible for the noticed effect. As a matter of fact, in typycal diagrams, the neutralization partitioning circuit is just formed by that capacitor and by the high-voltage low-capacity variable capacitor directly connected to the tube plate.

Yes, on 80 meters the grid / plate capacitance is probably be too low for triggering an oscillation, but we are just talking of a modest offset the neutralization bridge that can only be detected when tuning the pi-network plate capacitor.

Anyway, let us read the tests results and then comment further.

OK, here are the test results:

I connected additional bypass capacitors across the cathode resistors and screen grid, just as Tony suggested. Nothing changed. I also checked the fixed tuning capacitors in the pi network, just as Kenneth suggested. Nothing found.

OK, all the caps were fine. So what else was wrong?

Well, I noticed that in CW and TUNE modes, the peak RF output was less than the peak audio output in LSB or USB. Strange. So I poked around and determined that the diode-based balanced modulator was not sufficiently =93imbalanced=94 for CW and TUNE. I think this was a combination of carbon resistor R402 having drifted higher in value (it=92s specified at 68K Ohms) and a bias supply voltage running a bit low (should be +250 VDC, but runs at +230 VDC). So I soldered a 220K Ohm resistor across R402 and now get full power in CW and TUNE because diodes in the modulator are now sufficiently forward biased.

So why was low power a problem?

Well, the peak-power-at-plate-current-dip rule really only applies at
full output power when finals are running class B. When I was tuning
in CW or TUNE, and didn=92t have full power, that rule didn=92t apply and
it looked as if the finals weren=92t neutralized. However, the apparent
neutralization problem didn=92t show up when I tuned-up the SB-401 by
applying a pure tone to the mic input in LSB or USB.

Because at low power the effective load resistance of the finals is much
higher than it is at low power, and the PI network does not match the
load to 50 ohms. The Q of the network at resonance is off, I'm not sure
if it is higher or lower .... depends on where the loading capacitor
ends up. Also on 80 meters the range of the capacitors is limited to
begin with....

> begin with....

Yup. I'm sure the difference in load resistance was at play.

Since my last post, I permanently replaced the aforementioned 68K Ohm
resistor (R402) with a 200K Ohm in parallel with a 100K Ohm. The
original carbon composition resistor had a resistance of 380K Ohms--
over five times its original value. That's the largest amount of
drift I've ever encountered.

Also, I now get grid current during key-down in CW and TUNE.

Thanks for all the help, guys.

FDC FD-880 Dual Band 136-174/400-480Mhz FM Radio
http://www.409shop.com/409shop_product.php?id=3D106081
Special features

Dual band,dual Freq.,dual display and dual standby
 Working Mode:U-V,U-U,V-V can be set freely.
 Band can be set freely on the same channel:VHF TX-UHF RX or UHF TX-VHF RX.

PTT ID function;DTMF function
 Offset Freq and Freq.shift direction can be set.
 Keypad lock (Auto/Manual);Busy channel lockout

Water-proof;Wired clone function
 Built-in FM radio;Led flashlight
 3 displaying modes selectable(CH,FREQ,CH Name)

VOX function;Stopwatch function
 Priority Scan;Multiple Scan modes;Adding channel scan
 Emergency Alarm function;Wired clone function

Reverse freq.function
 Multipe Step frequency(5/6.25/10/12.5/25/50/100KHz)
 Charging directly from the power supply.You can also
charge your radio by connecting the supplied ac adapter directly to

your radio.

Technical specifications

Model NO. FD-880(Dual-band)

General Frequency Band	VHF UHF
Frequency Range	136-174MHz 400-480MHz
Channel Capacity	128
Operating Voltage	7.2V DC =B115%
Antenna Impedance	50O
Channel Spacing	12.5kHz/25kHz
Working Temperature	-30 ? - +60 ?
Frequency Stability	=B12.5 ppm
Size (Without Antenna)	104(W)mmx62(L)mmx36mm(D)
Weight(With Battery)	about 250g
Battery	1500 mAh(Li-ion)
Transmitter RF Pwr Output	5W/4W
Modulation Type	F3E
Modulation Distortion	< 5%(300-3000Hz)
Max Freq Deviation	< 5kHz(1000Hz When 100%)
FM Noise	<=3D-45dB

Receiver

Sensitivity	(12Db SINAD) 0.16=B5V
Selectivity	55dB
Adjacent Channel Selecivity	>=3D70dB
Noise Respond	>=3D60dB
Communication Range	3-5km(Downtown),6-20km(In the Open Area)
FM Noise	30dB/40dB
Modulation Type	8K/16KF3E
Audio Power Output	500mW When Distortion Less Than 10%
Audio Distortion	< 5%
Operating Bandwidth	=B13.5kHz/3.75kHz
Standby Current	< 12mA

Each Set PACKAGE CONTAIN

1 x FDC FD-880 (VHF136-174 / UHF 400-480Mhz Dual Band)
1 x 7.4v 1600mAh Li-ion Battery
1 x Dual band Antenna.
1 x Belt Clip.
1 x ENG Manual
1 x Wall Charger PSU (Provide PSU plug for your Country)
1 x 12V Car Charger Cable
1 x PTT Earpiece for free

Does anyone know of a good reliable meter repair shop that can repair a taut band meter that has a broken band? None of the local shops repair, just replace.

Thanks,

Jim, WA5DXP

Hello, My apologies for the intrusion. but I have a question that I
am
hoping someone has an answer to. I have never posted to a news

```
group,
so again, my apologies if this does not meet the standard protocol.

I have a bunch of Raytheon Subminiature tubes that I inherited from
my
Father, who was an electronics bugg (I followed a different path)
that
have code QF-721.  In searching the internet I have found a bunch of
identical looking tubes such as one labeled CK6088. I have done lots
of searches on the internet and I cannot find out anything about
these
and am wondering if you know about these, or if you can point me to a
website that might shed some light on these.

I am considering the possibility of donating these to someone but if
I
cannot find out what they are for, I cannot imagine how I can find
who
to donate them to -- perhaps a school or something.

Any of the ARRL handbook "novice transmitter" circuits, spanning several decades from the 40's to the early 70's, showing a 6L6 or 807 or sweep tube final, ought to be useful. I think every handbook had this style of transmitter, two tubes for crystal, add a third tube for VFO driving.

I bought a lot of Hallicrafters and the included S-20 is in sad shape. It has a fair amount of dents and dings to the trim and the sheet metal is rusting and needs refinished. It appeared to be mostly intact with missing knobs but I have the missing knobs from other radios. The tubes were pulled for shipping, but I have most of them as spares too.

It's more work than I want to tackle and I'd rather restore the others. Aside from gutting it for the field coil speaker, iron and toggle switches; is it worth more than $20-$25 plus shipping? If it is, then I'll sell it and let somebody else restore it, but if they're not worth the hassle, then I'll salvage what I can use and send off the sub-chassis to somebody that can use it.

Sorry if this comes across as trolling or spamming, but I don't want to scrap it and find out later that somebody else could have restored it and enjoyed it; however, I need the room for the other radios I plan to keep and restore.

The keepers are a black Sky Buddy, a S-40B, a mint S-58, a S-76, and a butchered SX-99 that has a replacement amp meter with more replacement knobs than originals. There is one other radio, but I forget the model.

The S-58 will be the easiest to get back in working order, then either the S-40B or S-76. The rest need more work and more parts to restore to original.

TIA,

- BMF

Is there anyone interested in Boontoon/Measurements model 260A Q meter,
model 59 Low Freq GDO, Model 59 HF GDO, model 82 signal generator, model 65B
signal generator, a General Radio 650A Impedance Bridge and a B&W model 211
generator. They are most likely in operable condition, but not tested.
They are in Hudson Florida and available cheap, but are probably not worth
shipping too far as all are heavy.   jack k8xx 231-649-6496

You'd be better off karma-wise selling it intact :) True, it won't
bring a bunch of money but there are plenty of folks looking for an
inexpensive beater to restore themselves.

Putting it in a box and shipping it is less hassle than stripping it to
parts and shipping the pieces individually, right?

GL,
Bill

Thanks Bill. That was kind of my point, the karma. I'm well on the good side right now since I just shipped off drivers, crossovers, and paperwork from the old Advent Large speakers as they needed to have the surrounds replaced and the cabinets were trashed. The new owner is building new cabinets for them and they will be better than new when he's done.

I'd only strip the PS iron and speaker as I took a good look at the toggles and they aren't worth the hassle of stripping out. I haven't stripped it of the iron yet, it's just missing the knobs and tubes. I have the knobs, but planned to allocate them to other radios.

Heck, I'd take $10 plus the shipping and packaging costs to just cover a small portion of my time and the materials. So I'll make a new post later with actual pics so somebody can see what they are in for. I'll give it a week to find a new home before it gets gutted and recycled.

The Sky Buddy may up in the same boat. It's in far better condition on the exterior, but my other radios cover the same bands so it's probably best to pass it on too.

It's just 42 days until the 2011 Charlotte Antique
Radio conference starts.
You can find lots of details on the Antique Radio Charlotte web page,
http://antiqueradiocharlotte.homestead.com/

A Google map to the conference site,
a printable pre-registration form,
a downloadable PDF brochure
plus a neat on-line flipbook version of the conference brochure.
Full conference schedule,
Equipment contest categories,
link to the Sheraton's web page,
and a FAQ page that'll cover most anything you
might need to know.

We look forward to seeing everyone in late March.

Greetings!

I have for sale a Hallicrafters S-38EB. The radio is in working order and is really good condition cosmetically with the exception of one side which has the requisite scrapes and some of the scrapes have some beginnings of rust. Not bad but there sure enough there. There are also some scrapes on the top toward that side.

The radio plays but needs the following done. There is enough hum in the audio that the filter caps should be replaced. The whole radio which looks very good inside, due to age should be replaced. The dial strings still work but should be replaced as well. Switches and pots need to be sprayed. The power cord needs to be replaced. Throw in a little cleaning and it is ready to go.

Now I could and might end up doing this but I would rather not. I had to buy this radio and one other that is probably going to go as well to get the one I really wanted. So with that said I would prefer to sell this one for $40 plus actual shipping.

So, if you are interested let me know. I have pictures if you want to see them. Hey, I mean the radio not me! Got to go. Jon Boy. kg4gfu.

Greetings!

I have for sale a Lafayette HA-600A General Coverage with ham bands
receiver.  The radio is in excellent working condition and is also
cosmetically very nice.  This one is all solid state, no tubes.  There
are no problems with this one at all.  It does drift a little until
warmed up and does better if just left on.  The glass on the front is
excellent.  There has been some loss of the printing above the knobs.
If I were to keep this one I would probably replace the printing
although it doesn't take a rocket scientist to figure out what is
what.  This radio was manufactured without an internal speaker.  I had
great results with an amplifed speaker.  At times it is a good idea to
crank down the RF gain due to added noise from my long wire antenna.
I have pictures if you are interested and feel free to ask questions.
I had to buy this one and another one to get the one I wanted so I
plan on just selling it to you.
The price is $60 plus actual shipping charges.  If you want it you had
better respond quickly as I believe it will go quickly at this
price.

Have a great week!  Jon Boy.  kg4gfu.

I find it sad that amateur radio operators feel the need to loose respect for each other just because these newsgroups are *mainly* accessed from the internet.

Mention the "internet" aspect of these forums and suddenly people feel it's ok to bash, curse, and make all out war with each other.

I should remind all that these newsgroups are also fed in and out of packet radio BBS stations and read and replied to over RF in nearly all countries utilizing packet BBS's.

Your name calling, cursing and war-ing all go out over the air ways and do nothing to foster and promote the art of amateur radio.

The 'art' of amateur radio?

A bunch of fat, sweaty, socially-maladjusted losers, sitting by themselves in their shacks for hours on end, grousing about how this newfangled interwebnet will never be as useful as the radio they built back in '63 and masturbating furtively over memories of Field Days past?

That's the reality of amateur radio today. As long as there are people like you who continue seeking to use yesterday's technology to solve yesterday's problems, I'll expect more whining along the lines of the above.

Let me spell it out for you: USENET - much like the rest of the Internet - was never intended for transport over amateur radio frequencies. That you (and others) do this is one thing, but pissing and moaning about the content of a medium not covered by FCC or international regulations is, frankly, idiotic on your behalf. Don't like it? Send your own damn traffic out over the airwaves. But don't expect the rest of us to kowtow to your demands.

People wonder why amateur radio is dying. You, my good man, exemplify one reason for that *exceptionally* well.

And, for the benefit of the masses who read USENET via their Icoms, Yaesus, or Kenwoods: FUCK SHIT PISS CUNT DICK BALLS ASS TITS BONER.

73s,

- J.

That was almost a sentence. Keep trying; perhaps you'll get it right
eventually!

Anyway, I now see why you're so deeply concerned about dirty words on
the Internet making it out over the airwaves:

http://groups.yahoo.com/group/BPQ32/message/3118 (May 1, 2010)
http://www.db0anf.de/app/bbs/messages/show-1239_KG6BAJ (May 3, 2010)

As I see it, this leaves you with two options:

- Fix your filters so that they actually work.

- Stop sending USENET posts over the airwaves.

There you go; problem solved.

Also, I'm pretty sure that I forgot to say 'dildo' in my original reply
to you. I'd hate to think that you missed out on my use of the word
'dildo', so here's a use of the word 'dildo' just for you:

DILDO.

Some good points. However, IMHO amateur radio should have no direct
connection to the internet.

Some do. Not all. Not even a significant percentage of all. Myself
excepted.

> I should remind all that these newsgroups are also fed in and out of packet

That is possibly illegal considering you are seemingly not vetting the
content. That would be the equivalent of transmitting porn videos on
70cm ATV and blaming the people who produced the tape/DVD. Moron. I
feel justified on that remark.

> Your name calling, cursing and war-ing all go out over the air ways and do
> nothing to foster and promote the art of amateur radio.

Then don't read it, don't transmit it via packet, print it and post it
on telephone poles on the corner, forward it to coworkers......

Get it yet?

What is this thread? Where did it come from, and what is it doing in
rec.radio.amateurs.boatanchors?

We don't care about your packet radio nonsense. If it doesn't have an 807
final at least, it probably doesn't belong in this newsgroup.

Sadder yet is the fact that the OP doesn't seem to realize that it's the responsibility of the control operator of the originating system to make sure that the traffic is suitable for sending over amateur radio.

And saddest of all is the OP's seemingly random selection of newsgroups, especially when he chose to identify himself as "no.spam@no.spam."

Hmm, I think we scared him away.  No loss.  I doubt he knows what
propagation is about or why some antennas are longer than 19 inches.

http://www.qrz.com/db/KG6BAJ

That should explain things a bit more - it's really sounding like he's
spent a little too much time with the TNC.  I've seen this happen before
when someone doesn't unplug themselves from the shack.

KG6BAJ, if you're reading this, spend some time away from the radios.
It'll help to readjust your perspective.

Greetings Paul!

Doing the repairs on the radio is what I am trying to avoid. I just
don't want to spend the time on this one. I do see one mistake in my
original post. I said that the radio although in good shape inside
needs to be "replaced", and of course what I meant to say is that it
should be "recaped". Also do remember it does work, it just needs a
little work which I have detailed.

I felt that based on the Ebay prices generally being a bit higher for
the same model radio in not as good condition, and also knowing what I
paid for it that I would start where I did. What whould you feel
would be a more realistic price? I also would consider offers. I do
appreciate your, or anyone elses input. Have a great week! Jon Boy.
kg4gfu.

Am looking for schematics for a HQ120X. I have all that BAMA offers. I
need something that gives voltages at different points. IE: Transformer
output, Tube output and test points. Some ads offer 'Rider" schematics
and are nothing more than the ones provided by the user manuals.
I am recaping some 120's and 129's and need all the help I can get!
Mike

There was a military version of the HQ-120-X, not sure
where those schemtics are but they would likely have more
information in them than the civilian versions.

I have been subscriber of K9YA Telegraph for a few years, and had
quite a few of the back issues on my hard drive, which just went
South and I lost them all.

Would anyone know of a site which archives them where I could
download them to my new hard drive?

Thanks for any leads,

Jim, WA5DXP

```

Thanks to Bill McCollum, KEØXQ, Section OO Coordinator, for providing this information.

Leo Meyerson, WØGFQ, of World Radio Laboratories fame will be featured on the March 9 edition of Willard Scott's segment of the Today Show.

Allen Pits, W1AGP, ARRL Public Information Officer, writes, " How good it will be to see one of Amateur Radio's living legends honored by national TV on NBC's The Today Show during portion of show where Willard Scott features centenarians & highlights of their lives. That's Wednesday morning, March 9."

73, Art KØAIZ

ARRL Nebraska Section
Section Manager: Arthur I Zygielbaum, K0AIZ

A little late, but could be of interest:

Try the 2E22 valve.

I used to work with this excellent valve during my military service in 1968, repairing military equipment that used it as supresor modulated.

It was built especially for that purpose.

Here are the specifications:

2E22
Power Pentode

Base & Bulb
EIA Base 5J

Mechanical Data

EIA Base 5J
Electrical Data

Heater Voltage .... 6.3 V
Heater Current .... 1.5 A
Direct Interelectrode Capacitances (approx)

Pentode
Input .... 13 pf
Output .... 8 pf
Grid to Plate .... 0.2 pf
Maximum Ratings (Design Center Values)

Pentode
Plate Voltage .... 750 V
Grid No. 2 Voltage .... 250 V

Plate Dissipation .... 30 W
Grid No. 2 Dissipation .... 10 W
Characteristics and Typical Operation

Class C Oscillator/Amplifier
Plate Voltage .... 750 V
Grid No. 3 Voltage .... 22.5 V
Grid No. 2 Voltage .... 250 V
Grid No. 1 Voltage .... -60 V
Grid No. 1 Current .... 6 mA
Plate Current .... 100 mA
Grid No. 2 Current .... 16 mA
Driving Power .... 0.55 W
Power Output (approx) .... 53 W
Characteristics and Typical Operation

Class C Modulated Amplifier (Supressor)
Plate Voltage .... 750 V
Grid No. 3 Voltage .... -90 V
Grid No. 2 Voltage .... 250 V
Grid No. 1 Voltage .... -90 V
Plate Current .... 55 mA
Grid No. 2 Current .... 29 mA
Power Output (approx) .... 16.25 W

The older model, all tubes. There's plenty of info out there on the 650-B, the newer one that matches the Yaesu FT-101 series. This is the FTV-650, which matches the FTDX-401 / FTDX-560 era radios.

Anyone?

My SB-200 works perfectly 80-15 meters. 10 M opened the other day and I found the SB-200 would not tune. Within 30 seconds one of the 572B's blew out and the breakers both tripped. My exciter, when used without the SB-200, tunes perfectly on 10 - very low SWR, etc. - so

it's not an antenna issue.
It's got me stumped. Built the linear in 1970 and never had a problem
til this.
Tnx - Harry

Used to work, doesn't work now -- sounds like a bad switch.

Exciter works fine, amp blows toobs -- sounds like something on the 'big
sparks' end of the amplifier.

No degradation noticed (or mentioned, at least), then suddenly things go
"blam"! -- sounds like a bad switch.

Bad contact on one of the bandswitch segments on the high power side of
the amp? That'd make the tuning be way off, which would load the tube
way wrong, which would make 'that expensive smell'.

Dunno -- things to check.

Had you ever used the SB-200 on 10 meters before?

For a good length of time, the FCC required that amps fail to operate
on 10M (really 11M was the target of the law but 10M got swept into
it) until a specific (available to "hams only" as if anyone else
should have a linear) mod had been applied. I forget when that law
went into effect but could it have been as far back as 1970?

Anyway when 10M opens up, 100W will generally do wonderfully (just my
two cents :-)!)

Tim.

I'd say, that as it was working fine on the lower bands, there is a good
chance that the neutralisation wasn't set right for Ten and the
amplifier went into self-oscillation, destroying one of the 572s.

I would have said something like that, but he said "built in 1970" so
unless he's off by about 7 years, it can't be the issue.

I thought the law was still in effect.

The problem was, anything that covered 10meters would cover 11meters,
they being adjacent. The issue was that while CB amplifiers were illegal,
lots of small companies would sell them as ham amplifiers, despite the
relatively low drive requirement (the same level that a CB set would put=20
out) and often not high power amplifiers. Even forty years ago, one
could look in the Lafayette catalog and see "illegal for Class-D CB"
amplifiers on the CB page, keeping Lafayette out of trouble at the time,
yet practically telling people "this is just what you need to boost your
power output on CB". And of course, since something illegal is about
making money, the amplifiers were often junk, so not only was there the
issue of high power where low power was the norm, but bad signals in
and out of the band.

Thanks for suggestion. I have some 2E22s, even some 2E24s (quick.heating versions).

The problem with the 2E22 is that the output power would be small (probably 10W or so) because, using suppressor screen modulation, the efficiency is rather low (<30%).

Using two 803s I can instead get 200W or perhaps 250W of carrier.

Hi Tony,

The 2E22 is a true pentode while the 2E24 is a quick heating filament
version of the 2E26. Both are beam power tetrodes and not suitable for
suppressor modulation. A pair of suppressor modulated 803's will deliver
approximately 100 watts of carrier.

Being a cathode driven amplifier, Heath did not use neutralization in the
SB-200. My best bet is a bad switch.

I guess to me it's pretty evident that anyone specifically telling you
something is available for the Kindle is looking to sell it, not give it away

(...in which case they could likely just use a PDF).

> Since I don't have an Amzon account, and I'm not about to spend $12 on it,
> is not available for MY kindle.

You can read Kindle books on most smartphones, Android tablets, and Windows PCs/tablets as well. The DRM is definitely annoying, although for a "fun read" sort of book like this (as opposed to, e.g., a reference text) I could see putting up with it.

It's not evident at all to me. After all, it was SPAMed to a bunch of newsgroups that don't allow sale postings.

As for Amazon, aren't there free books for the Kindle there?

>

Maybe he just wanted to use Amazon as the distributer, or had a friend in the Kindle publishing business?

Geoff.

Fair point, strictly speaking I would have to concur with you there, even if I
do consider it a pretty minor transgression.

> As for Amazon, aren't there free books for the Kindle there?

Yes, it's just that usually no one bothers to advertise them much due to the
lack of potential financial gain and all. :-)  (And I also think the 100% free
ones have to be physically downloaded via USB or WiFi to your PC -- you can't
get them over Amazon's "whispernet," which is just the Sprint cell phone
network where Amazon cut a deal with Sprint to deliver books in (near-) real
time, the price of this delivery being bundled into the price of the book.)

> Maybe he just wanted to use Amazon as the distributer, or had a friend in
> the Kindle publishing business?

I figured that, like many hams, he was thinking he'd charge an inexpensive
price and use the proceeds to buy more radios and antennas and produce more
episodes of SolderSmoke. :-)

Hi, Chris

Very good. I'm glad your 3-500Z survived OK.

People avoid the rectangular shaped resistors
(which look like cement) for this application - I don't know
if they feel that the insulation is insufficient
for the 3 KV to be encountered, or if they feel the resistor
won't shatter enough to act as a fuse.

Enjoy your SB-1000!

73,
Ed

Selected items will be held from sale to other buyers, for 4 days
for payment to be received. (Therefore, PayPal is highly recommended)
Will consider offers on 4 or more. (Won't hold them though, until
agreement is reached.
Shipping is $3.00 per shipment. (Example: Buy all of them, and shipping
is still only $3.00)
These are paper bound and in good condition unless stated otherwise.

***** INDIVIDUAL MODEL FLYERS   (remember, pages are not same as sheets)
For these Flyers the outside of the front and back count as
two
pages.

*MB10050 YAESU FT-1000MP 12 pages. VG $5.00
*MB10051 YAESU FT -1000 12 pages VG $5.00
*MB10052 YAESU FT -1000 12 pages VG $5.00
*MB10053 YAESU FT-2200/FT7200 4 pages VG $3.00
*MB10054 YAESU FT-2500M 4 pages VG $3.00
*MB10055 YAESU FT-5100 4 pages VG $3.00
*MB10056 YAESU FT-8500 4 pages VG $3.00
*MB10057 YAESU FT-50/10/40R   4 pages VG $3.00

I would test any wire would resistor with a grid dip meter to make sure
it ISN'T self resonant on any ham band, otherwise it will fail again.
OR You can prevent the self resonant problem by putting a .01 uf 1000v
```

ceramic capacitor in parallel with it.

Hi, Ken

I have to disagree with you about the added capacitor you suggest.

The added resistor is intended to act as a fuse,
on the output side of the HV supply. If it opens (by exploding),
the parallel capacitor will have 3 KV across it, assuming
the short condition is still present downstream, so a 1KV rated
capacitor is inadequate.
Plus, we want all of the voltage spike to be across the resistor,
so it blows up "real good". A capacitor across the resistor
would have the effect of slowing the resistor failure time.

There should be little or no rf current in the resistor,
so no need to test it with a grid dipper.
The resistor is isolated from the 3-500Z by the plate choke,
and bypass capacitors shunt the rf to ground in the HV line.

73,
Ed Knobloch

If there IS an rf bypass capacitor between the 'cold' end of the plate
choke and ground then my suggestion isn't needed. If the only bypass at
the cold end of the choke is though the power supply, then one should be
added. In some amplifiers a second rf choke is placed in series with
the main plate choke and a bypass capacitor to ground is placed between
them. Such a bypass capacitor should be one of those 'doorknob' types.

One thing that has not been mentioned is that an amp should not be driven with grid current and no plate current. If you see no plate current, the full power of the transmitter is absorbed in the grids, which will destroy them. As soon as you lose plate current, shut down and find out why.

Ceramic resistors are not used simply because when they explode, you have nasty particles of ceramic all over. Somewhat like a slightly docile grenade. Wire wound resistors do not do that - generally.

73, Colin K7FM

Good points - thank you, Colin.

I figured the ALC from the amp would crank back the exciter
to prevent grid damage in the amplifier, in the absence
of amplifier plate voltage, but I was probably mistaken.

Thanks, Ken, good points.

Basically the added 10 Ohm 10 Watt resistor
is intended to interrupt the energy from the power supply
electrolytics in the event of an arc-over in the final tube.
By the time the primary fuse kicked in, the damage would be done.

They do sell HV fuses suitable for the purpose, used
in microwave ovens. I see some on eBay for around $8 each,
rated for 5KV interruption.

The 3-500Z is a fairly robust tube and can take a bit of abuse like that before it is destroyed. (At least the Eimac built tubes could, I don't know about the Chinese clones). OTOH ceramic metal external anode tubes usually DON'T have a grid structure that can tolerate such abuse and WILL suffer 'meltdown' if not treated correctly. This is why the 4cx250 series CANNOT be used in grounded grid operation. They CAN be used as cathode driven tetrodes in AB1 (NO GRID CURRENT) however.

```

The following are for sale.

PayPal or personal checks. PayPal takes credit cards.
Shipping to be added. Ship USA only.

VHF great looking homebrew transmitter. Must look at this.
(I got this with a Motorola power supply.
I'm not offering the power supply, but if someone is
interested in it. I estimate the weight of the power supply without the
transformer at 50 lbs, and the transformer at 70 pounds.) Neither the
transmitter nor the PS have been tested. The tube is a PL 4D21.
I will use 13 lbs as the shipping weight. $95.00
http://www.muchstuff.com/3-9-11mics/p1000756.jpg
http://www.muchstuff.com/3-9-11mics/p1000757.jpg

"Bud" index card metal box. I will use 1 lb. as shipping weight. $10.00
http://www.muchstuff.com/3-9-11mics/p1000760.jpg

Old, and I mean OLD!, Rheostat. 1.25 Amp. 32 ohms. I will use 4.5 lbs
as
shipping weight. $5.00.
http://www.muchstuff.com/3-9-11mics/p1000762.jpg
http://www.muchstuff.com/3-9-11mics/p1000763.jpg
http://www.muchstuff.com/3-9-11mics/p1000764.jpg

Fujiden Low Pass filter. 50 ohms impedance. "Fc-32 MHz" 100 W. I will
use
1 lb. as shipping weight. $10.00
http://www.muchstuff.com/3-9-11mics/p1000766.jpg

Palomar Engineers CW Filter. I will use 1 lb. as shipping weight.
$10.00

Good looking WRL Galaxy 300 transceiver and accompanying PSA-300 power
supply, speaker and clock.
3 band, 80, 40 and 20 meters.
Receive works.
Transmit does not work.
There is High Voltage.
It appears that voltage is not getting to the T/R relay solenoid.
Includes a good clear manual copy.
Includes the cable.
Clock does not work, looks to be complete, but the motor is not running.
See the pictures, the outsides looks very good. The insides looks good to
fair.
$235.00 pickup in Auburn, CA. 95603
I am not excited about packing and shipping these two pieces; and to
prove my feelings, if someone wants to have me pack and ship, I will
charge $40 for packing, plus the shipping charge. My estimates of
shipping weights is 27 and 45 pounds.
(Please ignore my erroneously naming these picture files "globe" instead
of
"galaxy".

A. G. Lisi's E8 model may be showing us what both our space & time
really are.

(Click link below.)

http://www.amperefitz.com/e8.htm

Crystals and chemical compounds are tied up with group theory which
best explains (mathematically) exactly why they form the particular
way they do.

Lisi's E8 model is a group theory model that may be showing us why our
space forms the way it does via frequencies that cannot be directly
measured from inside of our particular space-time realm (Wheeler -
Feynman).

Click link below for MORE:

http://www.amperefitz.com/e8.htm

Where did you get the new 572B's? I've heard that no matter WHO sells
them or what label is on the bottle, they are all made in the same
factory in China today. I suppose some of the importers may test them
better and have in their contract that they can return tubes that fail
their tests to the factory for credit, so where you buy them from might
make a difference, but you are still getting the same tubes.

If you are REAL lucky you might still be able to find some NOS US made
572B's, but they won't be cheap. The Svetlana 572B's are NOT the same
spec's as the ones used in most ham linears. They are AUDIO tubes!
They will work in a ham linear but you must keep the plate voltage at
2000 or less, maybe apply some bias, and be happy with less power.

Subscribe FREE to the K9YA Telegraph. It's Free, It's Fun, It's All About Ham Radio.

The K9YA Telegraph is a free, monthly, general interest amateur radio publication read by Hams in more than 100 countries. The K9YA Telegraph contains the stories and features most wanted by our readers, because it is written by them. An e-Zine, it is delivered monthly as a full-color PDF file.

If you're in the mood for Morse, hankering for history, gluttonous for gear, ravished for a review, needing nostalgia, or just plain famished for fun, you'll find it in the K9YA Telegraph.

To check out sample issues, subscribe or write an article, visit the K9YA Telegraph Web site.

Does 5/23 mean 22/5/11?

Want to buy: Cable for Multi-Elmac M-1070/AF-68/PMR-8
This is a 3 headed cable. 11 pin "octal", 10 pin Jones plug, and 15 pin
Jones plug.
I'll buy separate ones and join them, if that's the best I can find.
The separate ones would be either, 11 and 10, or the 11 and 15.

Gene Rippen, WB6SZS
Auburn, CA

These are all standard connectors. Newark ought to have them in stock,
if not, Connector World Supply in Seattle will.

I'm interested in getting several of these filters (for the 75A4):

500 Hz, anything between up to but not including 3.1 kHz.

Need sources, prices.

Make reply post or send private email to the source of this post
(=arthures@mv.com)

Thanks.

Rockwell-Collins still makes the size J filters. From the 2005 catalogue:

NSN	Type	Bandwidth
526-9089-000	F455J-31	2.8
526-9091-000	F455J-60	5.5
526-9154-000	F455J-05	0.38
526-9155-000	F455J-15	1.2
526-9156-000	F455J-21	2

You can also make adaptors out of perfboard to fit the PC board mount filters onto a socket, if you find them at a hamfest.

Otherwise try collinsfilters@rockwellcollins.com.

Does 'better' mean tighter or less ringing?

There are sure times when I wish I had a less nasty-sounding filter for
AM on the R-390.

I'll have to put on my "to do" list that I need to search the web for sources of these filters (as well as ER magazine). And, see if Collins has a website of their own (I should have done that, too, but I have variable lazyness...and I'm not in a big hurry on this project).

I did send to that Collins email address a request for further information and have not, as yet, received an answer (I notice email responses to email queries can be all over the spectrum from minutes later to days later to no answer at all).

For a nice-sounding CW filter, I have used an audio frequency equalizer (picked up mine from a thrift store for $5, its a Realistic [Radio Shack] jobber). I max boost 500 Hz sliding pot on both channels, and max depress the pots on all other frequencies, and feed speaker output into input of one channel, output of that channel into input of the other channel, and run output of other channel into input of an amplifier driving either a speaker or earphones. Bandwidth "sounds" (not measured) like maybe about 300-400 Hz. The next frequencies above and below 500 Hz are 250 Hz and 1 kHz. I might get narrower if I boost at 250, etc, but tone is too low for my ears. I thought I wasn't getting any detectable ringing at all on this setup. The calibrations are max/min 12 db, so that should put unwanted frequencies down 24+ db per channel, or 48 db for both, no?

Scott, for AM on the R-390: are you sure its the filter? Not distortion in the audio string? Have you tried any other post detection path (eg. a separate receiver, even an old AM radio where you feet the 455 kc output from the R-390 to the input of the IF on the AM radio and see what audio quality you can get? I'm not familiar with the R390 (does it have mechanical filters?).

I max boost 500 Hz sliding pot on both channels, and max depress the pots on all other frequencies, and feed speaker output into input of one channel, output of that channel into input of the other channel, and run output of other channel into input of an amplifier driving either a speaker or earphones. Bandwidth "sounds" (not measured) like maybe about 300-400 Hz. The next frequencies above and below 500 Hz are 250 Hz and 1 kHz. I might get narrower if I boost at 250, etc, but tone is too low for my ears. I thought I wasn't getting any detectable ringing at all on this setup. The calibrations are max/min 12 db, so that should put unwanted frequencies down 24+ db per channel, or 48 db for both, no?

You might try setting the filters on the two ears a little bit different, so that higher tones are to the right and lower tones are to the left. I find this helps pick out signals from a pileup.

The filters on those cheap EQs are probably fairly wide; you can measure the Q with a meter and a signal generator if you want to really know.

>Scott, for AM on the R-390: are you sure its the filter? Not distortion in the audio string? Have you tried any other post detection path (eg. a separate receiver, even an old AM radio where you feet the 455 kc output from the R-390 to the input of the IF on the AM radio and see what audio quality you can get? I'm not familiar with the R390 (does it have mechanical filters?).

There is lots of distortion in the audio string, although the line output is definitely much cleaner than the speaker level output. However, there is just outrageous amounts of ringing on the 8KC filter. If I go to the 16 KC filter it's much cleaner but of course there's a wider bandwidth too.

FWIW, I have an F 455 J 31 in front of me that I'd be happy to part with for any reasonable payment. As far as I know, it's in good condition, removed from (if I'm not mistaken) a Collins 490T HF avionics transceiver. I'd be happy to check it on an HP8753ES network analyzer to insure it's OK, if I find info on pin connections and in/out matching to the analyzer's 50+j0 ohms. I gather this is the one you _don't_ need, but perhaps someone else does. (Looks like probably pins 1&2, and 6&7, are the in/out...9 pin miniature tube base.)

Cheers,
Tom

Just found, more 2 pin mic connectors for your BA transmitters.
These are new, unused panel mount 2 pin mic connectors. Very hard to find.

Price is $10 for 2 panel mount connectors postage included.

You can see photos of them here;
http://radioheaven.homestead.com/2pinmicplug.html

Paypal preferred, checks or MOs accepted.

Please contact via email to place your orders.

I have a limited quantity of these connectors so get yours now before
I run out.

Am needing to align a general coverage short wave receiver with 3 IFs, 60 kc, 455 kc and 3035 kc IF. The bandpass filter is on the 60 kc IF. Am needing a sweep generator to assist me and wondering if anyone has a suggestion for a usable one, not pricey or lab grade (because I'm broke)? Need something that will generate a sweep from about 50 kc to 500 kc with a sweep width of at least 15 kc. Appreciate your suggestions for which models to try to sniff out. Thanks.

Got a signal generator that (a) will cover those ranges and (b) has a DC-coupled FM input?

Got another signal generator that will do ramps or sawtooths at the rate you'd like to sweep the IFs?

Drive the FM input with the ramp or sawtooth, watch the frequency sweep linearly.

For that matter, since it's a fairly small variation that's needed, one
could add a varactor to an existing signal generator or VFO, and put a
ramp into that. In the old days, the suggestion was to use the ramp from
the oscilliscope, after all, if you don't take it from the scope, you'll
have to feed the ramp that comes from wherever into the scope so the
bandpass actually displays properly.

The 60 and 455KHz signals would be really easy to build an oscillator
with a small amount of sweep range for, the 3035KHz would just require
more effort at making a stable oscillator to begin with.

I see the Waveteks at hamfests in the $25 range. They are nothing to write
home about but fine for the job.

The AN/URM-25D is a personal favorite if you like big and green things.
Usually by the end of the day at the hamfest, people will pay you to take
them away. They are reliable and stable.

We need more diagnostics to come up with better suggestions (I read the other responses, too).

1. How do you "tune" your amplifier? Are you looking at RF output as you move the plate tuning knob?

2. Like someone else asked: had you ever had it on 10 meters in the past?

3. How did you perceive one of the 572s blow? (flash of light? filament go out? noise? smoke/smell?).

Look inside, see if you have a cold solder joint on 10 meter position of bandswitch?

Get one new 572B and restore to test on other bands, first.

Don't wait 30 seconds before you remove drive.

Use less drive (carrier) next time.

Another possibility is that there was some kind of "short" that developed inside the tube.

Next time check for output on at least one other band before you try 10 meters again.

FS: 26 mics working, plus 15 nonworking.

PayPal or your personal check. PayPal takes credit cards.
Shipping to USA only.

Here are pics of the working mics:
Use 18 lbs for shipping weight of these working mics..
http://www.muchstuff.com/3-9-11mics/p1000773.jpg
http://www.muchstuff.com/3-9-11mics/p1000775.jpg
http://www.muchstuff.com/3-9-11mics/p1000776.jpg
In the first picture are:
1 st row, from left:
J-465/U Mic and Ear phone
Electro Voice 205 "Differential Microphone" (This one I don't know if it works)
Monarch 1M-25 Dynamic.
Realistic 200 ohm dynamic
No description mic.
AIWA DM-61 10,000 ohm dynamic

2nd row
Calrad lapel mic.
Sony F-10S
(no name) Crystal CM-58
Astatic 525 (not good looking)
No description mic
AIWA DM-61 10,000 ohms dynamic.
Realistic
3rd row:
Shure CA-88 (Has "BL" on the front)
Shure EM-2-A (Ugly)
Shure CR-81 Controlled Reluctance
Shure 202
Concertone CDM-10 10,000 ohm dynamic
No description mic.

2nd picture:
Shure 505C Controlled reluctance. Hih impedance.
Astatic 333 (Rough looking)
Shure CA-82 "Stromberg Carlson"
No description mic.
"Olson (Rough looking)

3rd picture:
(2) AKAI (from tape recorder)

Here are pics of the nonworking mics:
Use 10 lbs for shipping weight of these nonworking mics.
http://www.muchstuff.com/3-9-11mics/p1000777.jpg

Use the shipping weight of both together of 27 lbs.

The price is $125 (or OBO, maybe)
The 15 nonworking parts mics are free, except for the additional shipping.

The following are for sale.
PayPal or personal checks. PayPal takes credit cards.
Shipping to be added. Ship USA only.

6 meter (I think) transmitter. Must look at this. (I got this with a
Motorola power supply. I'm not offering the power supply, but if someone
is
interested in it. I estimate the weight of the power supply without the
transformer at 50 lbs, and the transformer at 70 pounds.) Neither the
transmitter nor the PS have been tested. The tube is a PL 4D21.
I will use 13 lbs as the shipping weight. $95.00
http://www.muchstuff.com/3-9-11mics/p1000756.jpg
http://www.muchstuff.com/3-9-11mics/p1000757.jpg

Autek Research QF-1.   IC active filter. I will use 2 lbs as shipping
weight. $20.00
http://www.muchstuff.com/3-9-11mics/p1000758.jpg

"Bud" index card metal box. I will use 1 lb. as shipping weight. $10.00
http://www.muchstuff.com/3-9-11mics/p1000760.jpg

"Bud" "GIMIX" 10-80 meters. I will use 1.5 lbs. as shipping weight.
$10.00
http://www.muchstuff.com/3-9-11mics/p1000761.jpg

Old, and I mean OLD!, Rheostat. 1.25 Amp. 32 ohms. I will use 4.5 lbs
as
shipping weight. $5.00.
http://www.muchstuff.com/3-9-11mics/p1000762.jpg
http://www.muchstuff.com/3-9-11mics/p1000763.jpg
http://www.muchstuff.com/3-9-11mics/p1000764.jpg

Fujiden Low Pass filter. 50 ohms impedance. "Fc-32 MHz" 100 W. I will
use
1 lb. as shipping weight. $10.00
http://www.muchstuff.com/3-9-11mics/p1000766.jpg

Palomar Engineers CW Filter. I will use 1 lb. as shipping weight.
$10.00
http://www.muchstuff.com/3-9-11mics/p1000765.jpg

Cigar Box with 9 PM speakers. All, but one, are probably unused. I will
use 2.5 lbs
for shipping weight. $15.00

http://www.muchstuff.com/3-9-11mics/p1000767.jpg

Subscribe FREE to the K9YA Telegraph. It's Free, It's Fun, It's All About Ham Radio.

The K9YA Telegraph is a free, monthly, general interest amateur radio publication read by Hams in more than 100 countries. The K9YA Telegraph contains the stories and features most wanted by our readers, because it is written by them. An e-Zine, it is delivered monthly as a full-color PDF file.

If you're in the mood for Morse, hankering for history, gluttonous for gear, ravished for a review, needing nostalgia, or just plain famished for fun, you'll find it in the K9YA Telegraph.

To check out sample issues, subscribe or write an article, visit the K9YA Telegraph Web site.

The SB200 was made before the 11 meter regulation came into being. The
SB201 was the re-designed amplifier that covered this. However, being a
kit Heath complied with the law by leaving out the 10 meter switch label
on the front panel and not including in the instructions the steps to
connect the wires to the band switch. All the required parts were
actually in the kit. If you sent the company a photo copy of your ham
ticket (or even a QSL card) they would send you the missing page in the
manual. But it only required a half a brain to figure it out on your own.

Other companies complied with the law in different ways. One linear
only required removing a screw from the band switch that served as a
stop to prevent the amp from going into the 10 meter position! My
Kenwood linear required adding one or two capacitors in the front end
and adjusting a coil. I also had to add a decal to the front panel for
10 meters (I used a dymo label).

I ' Windows 7 Professional 32bit' (http://www.windows7key.eu/) want ' Office 2010 X86' (http://www.office2010key.ca/) to get' Microsoft Office 2007 Enterprise Activation' (http://www.office2007key.ca/) microsoft office 2010 but my ' Office Home And Student 2010 X86' (http://www.office2010key.ca/) has ' Windows 7 Starter Serial' (http://www.windows7key.ca/)the 2007 trial ' Office Professional Plus 2010 X86' (http://www.office2010key.ca/) when I purchased the disk from my school. Well the computer got fixed and the company that fixed it drained all my important things that I had on the computer. They said I ' Microsoft Office Pro Plus 2007 Key' (http://www.office2007key.ca/). Is it a big ' Microsoft Office 2007 Professional Activation Key' (http://www.office-2007-key.co.uk/) to upgrade from the 2007 to the 2010 using the product key or am I better off with the cd' Office 2010 Standard Serial' (http://www.office-2010-key.co.uk/) instead? Has anyone 'Windows 7 Home Premium Serial Key' (http://www.windows7key.ca/) office 2010?'Windows 7

Pro Product Key' (http://www.windows-7-key.co.uk/) does it 'Windows 7
Ultimate X64' (http://www.windows7key.eu/) to the 2007?

List of Solutions Manuals and Test Banks
----

contact me to :   mattosbw1@gmail.com
mattosbw1(at)gmail.com

NOTE : "THIS SERVICE IS NOT AVAILABLE FOR :   CHINA, INDIA, RUSSIA, PAKISTAN, IRAQ, IRAN, PHILIPPINES, NORTH KOREA, NEPAL, BANGLADESH, SRI LANKA, MALDIVES, BHUTAN & COLOMBIA".

If your wanted solutions manual is not in this list, also can ask me if is available (it is a partial list). Then if you need solutions manual only contact me by email.

"ARE NOT AVAILABLES BOOKS IN DIGITAL FORMAT", ONLY SOLUTIONS MANUALS AND TEST BANKS.

This same "list of titles" of texts with availables solutions manual and/or test banks is for download from :

http://www.megaupload.com/?d=3DADDS77XH

I do not review the forums, just send me an email.

Solution Manual Mechanics of Fluids (3rd Ed., Potter)
Solution Manual Fluid Power with Applications (7th Ed., Esposito)
Solution Manual Mechanics of Fluids (4th Ed., Shames)
Solution Manual Applied Fluid Mechanics (6th Ed., Mott)
Solution Manual Applied Fluid Mechanics - SI Units (6th Ed., Mott)
Solution Manual Hydraulic Control Systems (Noah Manring)
Solution Manual Fluid Mechanics and Thermodynamics of Turbomachinery (5th Ed., S.L. Dixon)
Solution Manual Fluid Mechanics and Thermodynamics of Turbomachinery (6th Ed., S.L. Dixon & Cesare Hall)
Solution Manual The Design of High-Efficiency Turbomachinery and Gas Turbines (2nd Ed., David Gordon Wilson & Theododios Korakianitis)
Solution Manual Fundamentals of Turbomachinery (William Peng)
Solution Manual Principles of Turbomachinery in Air-Breathing Engines

(Baskharone)
Solution Manual Fundamentals of Jet Propulsion with Applications (Ronald D. Flack)
Solution Manual Extended Irreversible Thermodynamics (3rd Ed., D. Jou, J. Casas-Vazquez & G. Lebon)
Solution Manual Thermodynamics : An Integrated Learning System (Schmidt, Ezekoye, Howell & Baker)
Solution Manual Design of Fluid Thermal Systems (2nd Ed., William Janna)
Solution Manual Design and Simulation of Thermal Systems (N.V. Suryanarayana & Oner Arici)
Solution Manual Introduction to Thermal and Fluids Engineering (Kaminski & Jensen)
Solution Manual Heating, Ventilating and Air Conditioning Analysis and Design (6th Ed., McQuiston)
Solution Manual Electricity, Electronics, and Control Systems for HVAC (4th Ed., Thomas Kissell)
Solution Manual Heat and Mass Transfer (Anthony Mills)
Solution Manual Heat Transfer (2nd Ed., A.F. Mills)
Solution Manual Basic Heat and Mass Transfer (2nd Ed., A.F. Mills)
Solution Manual Convective Heat and Mass Transfer (4th Ed., Kays & Crawford)
Solution Manual Advanced Engineering Thermodynamics (3rd Ed., Bejan)
Solution Manual Convection Heat Transfer (3rd Ed., Bejan)
Solution Manual Design with Constructal Theory (Adrian Bejan & Sylvie Lorente)
Solution Manual Shape and Structure, from Engineering to Nature (Adrian Bejan)
Solution Manual Thermodynamics : Concepts and Applications (Stephen Turns)
Solution Manual Heat Transfer (10th Ed., Jack Holman)
Solution Manual Principles of Heat Transfer (Kaviany)
Solution Manual Heat Convection (Latif M. Jiji)
Solution Manual Fundamentals of Momentum, Heat and Mass Transfer (5th Ed., Welty)
Solution Manual Analytical Methods for Heat Transfer and Fluid Flow Problems (Bernhard Weigand)
Solution Manual Two-Phase Flow : Theory and Applications (Clement Kleinstreuer)
Solution Manual Convective Heat Transfer (kakac)
Solution Manual An Introduction to Fluid Dynamics : Principles of Analysis and Design (Stanley Middleman)
Solution Manual An Introduction to Mass and Heat Transfer : Principles of Analysis and Design (Stanley Middleman)
Solution Manual Fundamentals of Thermodynamics (5th Ed., Richard Sonntag, Claus Borgnakke & Gordon Van Wylen)
Solution Manual Fundamentals of Thermodynamics (6th Ed., Richard Sonntag, Claus Borgnakke & Gordon Van Wylen)
Solution Manual Fundamentals of Thermodynamics (7th Ed., Claus Borgnakke & Richard Sonntag)
Solution Manual Introduction to Engineering Thermodynamics (1st Ed., Richard Sonntag & Claus Borgnakke)
Solution Manual Introduction to Engineering Thermodynamics (2nd Ed.,

Richard Sonntag & Claus Borgnakke)
Solution Manual Fundamentals of Engineering Thermodynamics (5th Ed., Michael Moran, Howard Shapiro)
Solution Manual Fundamentals of Engineering Thermodynamics (6th Ed., Michael Moran, Howard Shapiro)
Solution Manual Fundamentals of Engineering Thermodynamics - SI Units (6th Ed., Michael Moran, Howard Shapiro)
Solution Manual Fundamentals of Engineering Thermodynamics (7th Ed., Michael Moran, Howard Shapiro, Daisie Boettner, Margaret Bailey)
Solution Manual Fundamentals of Heat and Mass Transfer (5th Ed., Incropera, DeWitt)
Solution Manual Fundamentals of Heat and Mass Transfer (6th Ed., Incropera, DeWitt)
Solution Manual Introduction to Heat Transfer (4th Ed., Incropera, DeWitt)
Solution Manual Introduction to Heat Transfer (5th Ed., Incropera, DeWitt)
Solution Manual Radiation Detection and Measurement (3rd Ed., Glenn Knoll)
Solution Manual Radiation Detection and Measurement (4th Ed., Glenn Knoll)
Solution Manual Radiative Heat Transfer (2nd Ed., Michael Modest)
Solution Manual Computational Heat Transfer (2nd Ed., Jaluria)
Solution Manual Principles of Combustion (2nd Ed., Kenneth Kuan-yun Kuo)
Solution Manual An Introduction to Combustion : Concepts and Applications (3rd Ed., Stephen R. Turns)
Solution Manual Combustion (2nd Ed., Irvin Glassman)
Solution Manual Combustion (3rd Ed., Irvin Glassman)
Solution Manual Incompressible Flow (3rd Ed., Panton)
Solution Manual Modern Compressible Flow : With Historical Perspective (3rd Ed., John Anderson)
Solution Manual Non-Newtonian Flow : Fundamentals and Engineering Applications (R.P. Chhabra & J F Richardson)
Solution Manual Computational Techniques for Fluid Dynamics (Srinivas, K., Fletcher, C.A.J.)
Solution Manual Introduction to Computational Fluid Dynamics (A.W. Date)
Solution Manual Robot Modeling and Control (Spong, Hutchinson & Vidyasagar)
Solution Manual Introduction to Robotics: Analysis, Control, Applications (Saeed B. Niku)
Solution Manual Theory of Applied Robotics : Kinematics, Dynamics and Control (Reza N. Jazar)
Solution Manual Control of Robot Manipulators in Joint Space (R. Kelly, V. Santib=E1=F1ez, A. Lor=EDa)
Solution Manual Modelling and Control of Robot Manipulators (2nd Ed., Lorenzo Sciavicco, Bruno Siciliano)
Solution Manual Robotics : Modelling, Planning and Control (Bruno Siciliano, Lorenzo Sciavicco, Luigi Villani & Giuseppe Oriolo)
Solution Manual Fundamentals of Robotic Mechanical Systems : Theory, Methods, and Algorithms (3rd Ed., Jorge Angeles)
Solution Manual Kinematic Chains and Machine Components Design (Dan B.

Marghitu)
Solution Manual Kinematics, Dynamics, and Design of Machinery (2nd Ed., Waldron & Kinzel)
Solution Manual Kinematics and Dynamics of Machinery (3rd Ed., Charles E. Wilson & J. Peter Sadler)
Solution Manual Kinematics and Dynamics of Machinery - SI Units (3rd Ed., Charles E. Wilson & J. Peter Sadler)
Solution Manual Machines and Mechanisms : Applied Kinematic Analysis (3rd Ed., David H. Myszka)
Solution Manual Machines and Mechanisms : Applied Kinematic Analysis (4th Ed., David H. Myszka)
Solution Manual Mechanism Design : Analysis and Synthesis (4th Ed., Erdman, Sandor & Kota)
Solution Manual Mechanical Design : A Components Approach (2nd Ed., Peter Childs)
Solution Manual Mechanical Design of Machine Elements and Machines : A Failure Prevention Perspective (1st Ed., Collins)
Solution Manual Mechanical Design of Machine Elements and Machines : A Failure Prevention Perspective (2nd Ed., Collins, Busby & Staab)
Solution Manual Fundamentals of Machine Component Design (3rd Ed., Juvinall)
Solution Manual Fundamentals of Machine Component Design (4th Ed., Juvinall)
Solution Manual Design of Machine Elements (8th Ed., Spotts)
Solution Manual Machine Elements in Mechanical Design (4th Ed., Mott)
Solution Manual Machine Elements in Mechanical Design - SI Units (4th Ed., Mott)
Solution Manual Mechanical Design : An Integrated Approach (1st Ed., Ansel Ugural)
Solution Manual Design of Machinery (3rd Ed., Norton)
Solution Manual Design of Machinery (4th Ed., Norton)
Solution Manual Machine Design : An Integrated Approach (3rd Ed., Norton)
Solution Manual Machine Design : An Integrated Approach (4th Ed., Norton)
Solution Manual Mechanical Engineering Design (6th Ed., Shigley)
Solution Manual Mechanical Engineering Design (7th Ed., Shigley, Mischke & Budynas)
Solution Manual Shigley's Mechanical Engineering Design (8th Ed., Budynas & Nisbett)
Solution Manual Shigley's Mechanical Engineering Design (9th Ed., Budynas & Nisbett)
Solution Manual Fundamentals of Machine Elements (1st Ed., Hamrock)
Solution Manual Fundamentals of Machine Elements (2nd Ed., Hamrock)
Solution Manual Mechanics of Materials : A Modern Integration of Mechanics and Materials in Structural Design (Christopher Jenkins & Sanjeev Khanna)
Solution Manual Mechanics of Materials (3th Ed., Beer)
Solution Manual Mechanics of Materials (5th Ed., Gere & Timoshenko)
Solution Manual Mechanics of Materials (6th Ed., Gere & Timoshenko)
Solution Manual Mechanics of Materials (7th Ed., Gere & Goodno)
Solution Manual Mechanics of Materials (Ansel Ugural)
Solution Manual Mechanics of Materials : An Integrated Learning System

(1st Ed., Timothy Philpot)
Solution Manual Mechanics of Materials : An Integrated Learning System (2nd Ed., Timothy Philpot)
Solution Manual Mechanics of Materials (2nd Ed., Roy R. Craig)
Solution Manual Simplified Mechanics and Strength of Materials (6th Ed., James Ambrose)
Solution Manual Engineering Applications of Dynamics (Dean Karnopp & Donald Margolis)
Solution Manual Engineering Mechanics : Statics (Arthur Boresi, Richard Schmidt)
Solution Manual Engineering Mechanics : Dynamics (Arthur Boresi, Richard Schmidt)
Solution Manual Engineering Mechanics : Statics (5th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Statics - SI Version (5th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Statics (6th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Statics - SI Version (6th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Dynamics (5th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Dynamics - SI Version (5th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Dynamics (6th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Dynamics - SI Version (6th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Vector Mechanics for Engineers : Statics (7th Ed., Ferdinand Beer)
Solution Manual Vector Mechanics for Engineers : Statics (8th Ed., Ferdinand Beer)
Solution Manual Vector Mechanics for Engineers : Dynamics (7th Ed., Ferdinand Beer)
Solution Manual Vector Mechanics for Engineers : Dynamics (8th Ed., Ferdinand Beer)
Solution Manual Statics : Analysis and Design of Systems in Equilibrium (Sheppard & Tongue)
Solution Manual Statics : Analysis and Design of Systems in Equilibrium - Update Edition (Sheppard & Tongue)
Solution Manual Dynamics : Analysis and Design of Systems in Motion (Sheppard & Tongue)
Solution Manual Dynamics : Analysis and Design of Systems in Motion (2nd Ed., Sheppard & Tongue)
Solution Manual Statics and Mechanics of Materials : An Integrated Approach (2nd Ed., Riley, Sturges & Morris)
Solution Manual Mechanics of Materials (6th Ed., Riley, Sturges & Morris)
Solution Manual Basic Engineering Plasticity : An Introduction with Engineering and Manufacturing Applications (David Rees)
Solution Manual Theory of Plasticity (3rd Ed. Jagabanduhu Chakrabarty)
Solution Manual Deformation and Fracture Mechanics of Engineering Materials (4th Ed., Richard Hertzberg)

Solution Manual Deformable Bodies and Their Material Behavior (Haslach & Armstrong)
Solution Manual Intermediate Mechanics of Materials (1st Ed., Barber)
Solution Manual Elasticity (2nd Ed., J.R. Barber)
Solution Manual Elasticity : Theory, Applications, and Numerics (1st Ed., Martin Sadd)
Solution Manual Elasticity : Theory, Applications, and Numerics (2nd Ed., Martin Sadd)
Solution Manual Elasticity in Engineering Mechanics (2nd Ed., Boresi)
Solution Manual Advanced Mechanics of Materials (6th Ed., Boresi)
Solution Manual Advanced Mechanics of Materials (2nd Ed., Cook & Young)
Solution Manual Metal Fatigue in Engineering (2nd Ed., Stephens, Fatemi & Fuchs)
Solution Manual Applied Mechanics for Engineering Technology (8th Ed., Keith M. Walker)
Solution Manual Applied Statics and Strength of Materials (5th Ed. Limbrunner & Spiegel)
Solution Manual Statics and Strength of Materials (Robert Mott)
Solution Manual Applied Strength of Materials (4th Ed., Mott)
Solution Manual Applied Strength of Materials (5th Ed., Mott)
Solution Manual Intermediate Dynamics for Engineers (Marcelo R.M & Crespo da Silva)
Solution Manual Engineering Mechanics : Statics (Michael Plesha, Gary Gray & Francesco Costanzo)
Solution Manual Engineering Mechanics : Dynamics (Michael Plesha, Gary Gray & Francesco Costanzo)
Solution Manual Engineering Mechanics : Statics (4th Ed., Anthony Bedford & Wallace Fowler)
Solution Manual Engineering Mechanics : Statics (5th Ed., Anthony Bedford & Wallace Fowler)
Solution Manual Engineering Mechanics : Statics - SI Units (5th Ed., Anthony Bedford, Wallace Fowler & Yusof Ahmad)
Solution Manual Engineering Mechanics : Dynamics (4th Ed., Anthony Bedford & Wallace Fowler)
Solution Manual Engineering Mechanics : Dynamics (5th Ed., Anthony Bedford & Wallace Fowler)
Solution Manual Engineering Mechanics : Dynamics - SI Units (5th Ed., Anthony Bedford, Wallace Fowler & Yusof Ahmad)
Solution Manual Elastic And Inelastic Stress Analysis (Irving Shames)
Solution Manual Thermal Stresses (2nd Ed., Noda, Hetnarski & Tanigawa)
Solution Manual Strength of Materials - A New Unified Theory for the 21st Century (Surya Patnaik & Dale Hopkins)
Solution Manual Statics and Strengths of Materials (6th Ed., Morrow & Kokernak)
Solution Manual Statics and Strengths of Materials (7th Ed., Morrow & Kokernak)
Solution Manual Engineering Mechanics : Statics (11th Ed., Hibbeler)
Solution Manual Engineering Mechanics : Statics (12th Ed., Hibbeler)
Solution Manual Engineering Mechanics : Statics - SI Units (12th Ed., Hibbeler)
Solution Manual Engineering Mechanics : Dynamics (11th Ed., Hibbeler)
Solution Manual Engineering Mechanics : Dynamics (12th Ed., Hibbeler)

Solution Manual Engineering Mechanics : Dynamics - SI Units (12th Ed., Hibbeler)
Solution Manual Mechanics of Materials (4th Ed., Hibbeler)
Solution Manual Mechanics of Materials (6th Ed., Hibbeler)
Solution Manual Mechanics of Materials (7th Ed., Hibbeler)
Solution Manual Mechanics of Materials - SI Units (7th Ed., Hibbeler)
Solution Manual Mechanics of Materials (8th Ed., Hibbeler)
Solution Manual Statics and Mechanics of Materials (Beer, Johnston, DeWolf & Mazurek)
Solution Manual Statics and Mechanics of Materials (Bedford, Liechti & Fowler)
Solution Manual Statics and Mechanics of Materials (2nd Ed., Hibbeler)
Solution Manual Statics and Mechanics of Materials - SI Units (2nd Ed., Hibbeler)
Solution Manual Statics and Mechanics of Materials (3rd Ed., Hibbeler)
Solution Manual Energy Principles and Variational Methods in Applied Mechanics (2nd Ed., Reddy)
Solution Manual The Physics of Vibrations and Waves (6th Ed., Pain)
Solution Manual Engineering Vibrations (3rd Ed., Inman)
Solution Manual Mechanical Vibrations - SI Units (4th Ed., Singiresu S. Rao)
Solution Manual Mechanical Vibrations (5th Ed., Singiresu S. Rao)
Solution Manual Theory of Vibration : An Introduction (2nd Ed., A.A. Shabana)
Solution Manual Vibration of Discrete and Continuous Systems (2nd Ed., Ahmed Shabana)
Solution Manual Introduction to Finite Element Vibration Analysis (Maurice Petyt)
Solution Manual Vibrations and Stability : Advanced Theory, Analysis, and Tools (2nd Ed., Jon J. Thomsen)
Solution Manual Dynamics and Vibration : An Introduction (Magd Abdel Wahab)
Solution Manual Mechanical Vibration (William J. Palm, III)
Solution Manual Random Vibrations : Analysis of Structural and Mechanical Systems (Loren Lutes & Shahram Sarkani)
Solution Manual Mechanical and Structural Vibrations : Theory and Applications (by Jerry H. Ginsberg)
Solution Manual Fundamentals of Structural Integrity : Damage Tolerant Design and Nondestructive Evaluation (Alten F. Grandt)
Solution Manual A First Course in the Finite Element Method (4th Ed., Daryl L. Logan)
Solution Manual Finite Element Analysis Theory and Application with ANSYS (3rd Ed., Moaveni)
Solution Manual An Introduction to the Finite Element Method (3rd Ed., J. N. Reddy)
Solution Manual Fundamentals of Finite Element Analysis (1st Ed., David V. Hutton)
Solution Manual The Finite Element Method in Engineering (4th Ed., Rao)
Solution Manual The Finite Element Method in Engineering (5th Ed., Rao)
Solution Manual The Finite Element Method and Applications in Engineering Using ANSYS (Madenci & Guven)

Solution Manual Introduction to Finite Element Analysis and Design (Nam-Ho Kim, Bhavani V. Sankar)
Solution Manual Introduction to the Finite Element Method : Theory, Programming and Applications (Erik G. Thompson)
Solution Manual The Finite Element Method : Its Basis and Fundamentals (6th Ed., Zienkiewicz, R. L. Taylor & J.Z. Zhu)
Solution Manual Fundamental Finite Element Analysis and Applications : with Mathematica and Matlab Computations (Asghar Bhatti)
Solution Manual Advanced Topics in Finite Element Analysis of Structures : With Mathematica and MATLAB Computations (Asghar Bhatti)
Solution Manual Modeling and Analysis of Dynamic Systems (3rd Ed., Close)
Solution Manual Modeling and Simulation of Dynamic Systems (Robert Woods, Jr. & Kent Lawrence)
Solution Manual System Dynamics (1st Ed., William J Palm III)
Solution Manual System Dynamics (2nd Ed., William J Palm III)
Solution Manual System Dynamics and Response (S. Graham Kelly)
Solution Manual System Dynamics for Engineering Students : Concepts and Applications (Nicolae Lobontiu)
Solution Manual Dynamic Modeling and Control of Engineering Systems (2nd Ed., J. Lowen Shearer, Bohdan Kulakowski, John Gardner)
Solution Manual System Dynamics : Modeling and Simulation of Mechatronic Systems (4th Ed., Karnopp, Margolis & Rosenberg)
Solution Manual Concepts and Applications of Finite Element Analysis (4th Ed., Cook, Malkus, Plesha & Witt)
Solution Manual Finite Element Modeling for Stress Analysis (Robert Cook)
Solution Manual Fracture Mechanics : Fundamentals and Applications (2nd Ed., T.L. Anderson)
Solution Manual Mechanical Behavior of Materials (3rd Ed., Dowling)
Solution Manual Mechanical Behavior of Materials (W.F. Hosford)
Solution Manual Mechanical Behavior of Materials (Keith Bowman)
Solution Manual Theory and Design for Mechanical Measurements (4th Ed., Figliola & Beasley)
Solution Manual Theory and Design for Mechanical Measurements (5th Ed., Figliola & Beasley)
Solution Manual Mechanical Measurements (6th Ed., Beckwith, Marangoni & Lienhard)
Solution Manual Measurement and Data Analysis for Engineering and Science (Patrick Dunn)
Solution Manual Design and Analysis of Lean Production Systems (Askin & Goldberg)
Solution Manual Computer-Aided Manufacturing (3rd Ed., Tien-Chien Chang, Richard A. Wysk, Hsu-Pin Wang)
Solution Manual Work Systems : The Methods, Measurement & Management of Work (Mikell P. Groover)
Solution Manual Automation, Production Systems, and Computer-Integrated Manufacturing (2nd Ed., Groover)
Solution Manual Automation, Production Systems, and Computer-Integrated Manufacturing (3rd Ed., Groover)
Solution Manual Fundamentals of Modern Manufacturing : Materials, Processes, and Systems (3rd Ed., Mikell Groover)
Solution Manual Fundamentals of Modern Manufacturing : Materials,

Processes, and Systems (4th Ed., Mikell Groover)
Solution Manual Materials and Processes in Manufacturing (9th Ed., E. Paul DeGarmo, J. T. Black, Ronald A. Kohser)
Solution Manual DeGarmo's Materials and Processes in Manufacturing (10th Ed., E. Paul DeGarmo, J. T. Black, Ronald A. Kohser)
Solution Manual Principles of Metal Manufacturing Processes (Beddoes & Bibby)
Solution Manual Design for Manufacturing : A Structured Approach (Corrado Poli)
Solution Manual Fundamentals of Manufacturing (2nd Ed., Philip D. Rufe)
Solution Manual Engineering Materials Science (Milton Ohring)
Solution Manual Engineering Materials : Properties and Selection (8th Ed., Budinski)
Solution Manual Engineering Materials : Properties and Selection (9th Ed., Budinski)
Solution Manual Materials Science for Engineering Students (Traugott Fischer)
Solution Manual Essentials of Modern Materials Science and Engineering (James Newell)
Solution Manual Science and Design of Engineering Materials (2nd Ed., Schaffer, Saxena, et al)
Solution Manual Structure and Properties of Engineering Materiales (5th Ed., Daniel Henkel & Alan Pense)
Solution Manual Materials Selection in Mechanical Design (3rd Ed., Michael Ashby)
Solution Manual Materials Selection in Mechanical Design (4th Ed., Michael Ashby)
Solution Manual Materials : Engineering, Science, Processing and Design (1st Ed., Michael Ashby, Hugh Shercliff & David Cebon)
Solution Manual Materials : Engineering, Science, Processing and Design (2nd Ed., Michael Ashby, Hugh Shercliff & David Cebon)
Solution Manual Engineering Materials Vol. 1 : An Introduction to Properties, Applications and Design (3rd Ed., Michael Ashby & David Jones)
Solution Manual Engineering Materials Vol. 2 : An Introduction to Microstructures, Processing and Design (3rd Ed., Michael Ashby & David Jones)
Solution Manual Materials Science and Engineering : An Introduction (6th Ed., William Callister)
Solution Manual Materials Science and Engineering : An Introduction (7th Ed., William Callister)
Solution Manual Materials Science and Engineering : An Introduction (8th Ed., William Callister)
Solution Manual Fundamentals of Materials Science and Engineering : Integrated Approach (2nd Ed., William Callister)
Solution Manual Fundamentals of Materials Science and Engineering : Integrated Approach (3rd Ed., William Callister)
Solution Manual Foundations of Materials Science and Engineering (3rd Ed, Smith)
Solution Manual Foundations of Materials Science and Engineering (4th Ed, Smith & Hashemi)
Solution Manual Foundations of Materials Science and Engineering (5th

Ed, Smith & Hashemi)
Solution Manual Introduction to Materials Science for Engineers (6th Ed., Shackelford)
Solution Manual Introduction to Materials Science for Engineers (7th Ed., Shackelford)
Solution Manual Introduction to Materials Science for Engineers - International Edition (7th Ed., Shackelford)
Solution Manual Manufacturing Facilities Design and Material Handling (3rd Ed., Meyers & Stephens)
Solution Manual Manufacturing Facilities Design and Material Handling (4th Ed., Stephens & Meyers)
Solution Manual Manufacturing Processes for Engineering Materials (5th Ed. Kalpakjian & Smith)
Solution Manual Manufacturing Processes for Engineering Materials - SI Units (5th Ed. Kalpakjian, Smith & Chih-Wah Kok)
Solution Manual Manufacturing, Engineering & Technology (5th Ed. Kalpakjian & Smith)
Solution Manual Manufacturing, Engineering & Technology (6th Ed. Kalpakjian & Smith)
Solution Manual Manufacturing, Engineering & Technology - SI Units (6th Ed. Kalpakjian & Smith)
Solution Manual Principles of Corrosion Engineering and Corrosion Control (Zaki Ahmad)
Solution Manual Steels : Microstructure and Properties (3rd Ed. Bhadeshia & Honeycombe)
Solution Manual Analysis and Performance of Fiber Composites (3rd Ed., Bhagwan Agarwal, Lawrence Broutman & K. Chandrashekhara)
Solution Manual Nanoengineering of Structural, Functional and Smart Materials (Mark Schulz, Ajit Kelkar, Mannur Sundaresan)
Solution Manual Applied Manufacturing Process Planning : With Emphasis on Metal Forming and Machining (Nelson, Schneider)
Solution Manual Mastering CAD/CAM (1st Ed., Ibrahim Zeid)
Solution Manual Principles of CAD/CAM/CAE (Kunwoo Lee)
Solution Manual Computer Numerical Control : Operation and Programming (3rd Ed., Stenerson & Curran)
Solution Manual Introduction to Computer Numerical Control (4th Ed., Valentino & Goldenberg)
Solution Manual Linear State-Space Control Systems (Robert L. Williams, II & Douglas A. Lawrence)
Solution Manual Gas Turbine Theory (6th Ed., H.I.H. Saravanamuttoo, G.F.C. Rogers, H. Cohen & Paul Straznicky)
Solution Manual Rocket Propulsion Elements (7th Ed., George P. Sutton & Oscar Biblarz)
Solution Manual Rocket Propulsion Elements (8th Ed., George P. Sutton & Oscar Biblarz)
Solution Manual Orbital Mechanics for Engineering Students (1st Ed., Howard Curtis)
Solution Manual Orbital Mechanics for Engineering Students (2nd Ed., Howard Curtis)
Solution Manual Atmospheric and Space Flight Dynamics : Modeling and Simulation with MATLAB and Simulink (Ashish Tewari)
Solution Manual Flight Dynamics Principles (2nd Ed., by Cook)
Solution Manual Mechanics of Flight (1st Ed., Warren F. Phillips)

Solution Manual Mechanics of Flight (2nd Ed., Warren F. Phillips)
Solution Manual Modern Flight Dynamics (David K. Schmidt)
Solution Manual Fundamentals of Airplane Flight Mechanics (David G. Hull)
Solution Manual Dynamics of Flight : Stability and Control (3rd Ed., Bernard Etkin & Lloyd Duff Reid)
Solution Manual Aircraft Rescue and Firefighting (5th Ed., IFSTA)
Solution Manual Aircraft Propulsion (Saeed Farokhi)
Solution Manual Aircraft Performance (Maido Saarlas)
Solution Manual Design of Aircraft (Thomas C. Corke)
Solution Manual Flight Performance of Fixed and Rotary Wing Aircraft (Antonio Filippone)
Solution Manual Fundamentals Of Aircraft Structural Analysis (Howard Curtis)
Solution Manual Aircraft Control and Simulation (2nd Ed., Brian Stevens & Frank Lewis)
Solution Manual Aircraft Structures for Engineering Students (3rd Ed., T.H.G. Megson)
Solution Manual Aircraft Structures for Engineering Students (4th Ed., T.H.G. Megson)
Solution Manual Introduction to Aircraft Structural Analysis (T.H.G. Megson)
Solution Manual Mechanics of Aircraft Structures (2nd Ed, C. T. Sun)
Solution Manual Principles of Helicopter Aerodynamics (1st Ed., Leishman)
Solution Manual Fundamentals of Aerodynamics (2nd Ed., Anderson)
Solution Manual Fundamentals of Aerodynamics (3th Ed., Anderson)
Solution Manual Fundamentals of Aerodynamics (4th Ed., Anderson)
Solution Manual Fundamentals of Aerodynamics (5th Ed., Anderson)
Solution Manual Aerodynamics for Engineers (5th Ed., John Bertin & Russell Cummings)
Solution Manual Introduction to Flight (5th Ed., Anderson)
Solution Manual Introduction to Flight (6th Ed., Anderson)
Solution Manual Mechatronics : Principles and Applications (Godfrey Onwubolu)
Solution Manual Mechatronics (Sabri Cetinkunt)
Solution Manual Introduction to Mechatronic Design (J. Edward Carryer, Matthew Ohline & Thomas Kenny)
Solution Manual Introduction to Mechatronics and Measurement Systems (2nd Ed., David Alciatore & Michael Histand)
Solution Manual Introduction to Mechatronics and Measurement Systems (3rd Ed., David Alciatore & Michael Histand)
Solution Manual Introduction to Mechatronics and Measurement Systems (4th Ed., David Alciatore & Michael Histand)
Solution Manual Introduction to Engineering Experimentation (2nd Ed., Wheeler & Ganji)
Solution Manual Introduction to Engineering Experimentation (3rd Ed., Wheeler & Ganji)
Solution Manual Gas Dynamics (3rd Ed., John & Keith)
Solution Manual Fundamentals of Gas Dynamics (2nd Ed, Robert D. Zucker)
Solution Manual Theory of Ground Vehicles (3rd Ed., J. Y. Wong)
Solution Manual Theory of Ground Vehicles (4th Ed., J. Y. Wong)

Solution Manual Vehicle Dynamics : Theory and Application (Reza Jazar)
Solution Manual Internal Combustion Engines : Applied Thermosciences (2nd Ed., Ferguson & Kirkpatrick)
Solution Manual Advanced Engine Performance Diagnosis (4th Ed., James Halderman)
Solution Manual Automotive Engines (8th Ed., Crouse)
Solution Manual Automotive Heating & Air Conditioning (5th Ed., Tom Birch)
Solution Manual Diagnosis and Troubleshooting of Automotive Electrical, Electronic, and Computer Systems (5th Ed., James Halderman)
Solution Manual Automotive Brake Systems Package (4th Ed., Rehkopf)
Solution Manual Automotive Brake Systems (4th Ed., Halderman)
Solution Manual Automotive Engine Performance (2nd Ed., Halderman)
Solution Manual Automotive Engines : Theory and Servicing (6th Ed., James Halderman)
Solution Manual Automotive Fuel and Emissions Control Systems (2nd Ed., James Halderman & James Linder)
Solution Manual Automotive Science and Mathematics (Allan Bonnick)
Solution Manual Automotive Mathematics (Jason Rouvel)
Solution Manual Automotive Service Management (Andrew Rezin)
Solution Manual Automotive Technology : Principles, Diagnosis, and Service (3rd Ed., Halderman)
Solution Manual Automotive Steering, Suspension, and Alignment (4th Ed., Halderman)
Solution Manual Automatic Transmissions & Transaxles (4th Ed., Tom Birch & Chuck Rockwood)
Solution Manual Hybrid and Alternative Fuel Vehicles (Halderman & Martin)
Solution Manual Manual Drivetrains and Axles (5th Ed., Birch & Rockwood)
Solution Manual Blueprint Reading for the Machine Trades (6th Ed., Schultz & Smith)
Solution Manual Modern Welding Technology (6th Ed., Cary & Helzer)
Solution Manual Tissue Engineering (Bernhard O. Palsson & Sangeeta N. Bhatia)
Solution Manual Tissue Engineering (Clemens van Blitterswijk, et al.)
Solution Manual Tissue Mechanics (Cowin, Doty)
Solution Manual Technology and Society (3rd Ed., Hjorth, Eichler, Khan & Morello)
Solution Manual BTEC First Engineering Curriculum Support Pack (Mike Tooley)
Solution Manual BTEC First Engineering (Mike Tooley)
Solution Manual Exploring Engineering : An Introduction to Engineering and Design (1st Ed., Philip Kosky, George Wise, Robert Balmer & William Keat)
Solution Manual Exploring Engineering : An Introduction to Engineering and Design (2nd Ed., Philip Kosky, Robert Balmer, William Keat & George Wise)
Solution Manual Engineering Science (5th Ed., W. Bolton)
Solution Manual Principles of Energy Conversion (2nd Ed., Archie W. Culp)
Solution Manual Fundamentals of Renewable Energy Processes (1st Ed.,

Aldo da Rosa)
Solution Manual Fundamentals of Renewable Energy Processes (2nd Ed., Aldo da Rosa)
Solution Manual Alternative Energy Systems (B. K. Hodge)
Solution Manual Solar Energy Engineering : Processes and Systems (Soteris Kalogirou)
Solution Manual Solar Engineering of Thermal Processes (2nd Ed., John Duffie & William Beckman)
Solution Manual Solar Engineering of Thermal Processes (3rd Ed., John Duffie & William Beckman)
Solution Manual Energy Technology and Directions for the Future (Fanchi)
Solution Manual Power Generation Technologies (Paul Breeze)
Solution Manual Concepts in Engineering (Holtzapple & Reece)
Solution Manual Concepts in Engineering (2nd Ed., Holtzapple & Reece)
Solution Manual Foundations of Engineering (2nd Ed, Holtzapple & Dan Reece)
Solution Manual Industrial Mechanics and Maintenance (3rd Ed., Larry Chastain)
Solution Manual Mechanical and Electrical Equipment for Buildings (10th Ed., Stein, Reynolds, Grondzik, Kwok)
Solution Manual Mechanical and Electrical Equipment for Buildings (11th Ed., Grondzik, Kwok, Stein & Reynolds)
Solution Manual Mechanical & Electrical Systems in Buildings (4th Ed., Richard Janis & William Tao)
Solution Manual Engineering Drawing And Design (7th Ed., Jensen, Helsel & Short)
Solution Manual Autodesk Inventor (James M. Leake)
Solution Manual Engineering Design Graphics : Sketching, Modeling, and Visualization (1st Ed., James Leake & Jacob Borgerson)
Solution Manual Orthopaedic Biomechanics : Mechanics and Design in Musculoskeletal Systems (Donald Bartel, Dwight Davy & Tony Keaveny)
Solution Manual Science for Engineering (3rd Ed., John Bird)

List of Solutions Manuals and Test Banks

contact me to :   mattosbw1@gmail.com
mattosbw1(at)gmail.com

NOTE : "THIS SERVICE IS NOT AVAILABLE FOR :   CHINA, INDIA, RUSSIA, PAKISTAN, IRAQ, IRAN, PHILIPPINES, NORTH KOREA, NEPAL, BANGLADESH, SRI LANKA, MALDIVES, BHUTAN & COLOMBIA".

If your wanted solutions manual is not in this list, also can ask me if is available (it is a partial list). Then if you need solutions manual only contact me by email.

"ARE NOT AVAILABLES BOOKS IN DIGITAL FORMAT", ONLY SOLUTIONS MANUALS AND TEST BANKS.

This same "list of titles" of texts with availables solutions manual and/or test banks is for download from :

http://www.megaupload.com/?d=3DADDS77XH

I do not review the forums, just send me an email.

- Electrical, Electronics & Computer Engineering :

Solution Manual Antenna Theory and Design (2nd Ed., Stutzman & Thiele)
Solution Manual Antennas for All Applications (3rd Ed., John Kraus & Ronald Marhefka)
Solution Manual Principles of Neurocomputing for Science and Engineering (Fredric M. Ham & Ivica Kostanic)
Solution Manual Introduction to Algorithms (2nd Ed., Cormen, et al.)
Solution Manual Algorithms (Dasgupta, et al.)
Solution Manual Applied Operating Systems Concepts (Silberschatz, Galvin & Gagne)
Solution Manual Operating System Concepts (6th Ed., Silberschatz, Galvin & Gagne)
Solution Manual Operating System Concepts (7th Ed., Silberschatz, Galvin & Gagne)
Solution Manual Operating System Concepts (8th Ed., Silberschatz, Galvin & Gagne)
Solution Manual Operating Systems Concepts with Java (6th Ed., Silberschatz, Galvin & Gagne)
Solution Manual Operating System Concepts with Java (7th Ed., Silberschatz, Galvin & Gagne)
Solution Manual Operating System Concepts with Java (8th Ed., Silberschatz, Galvin & Gagne)
Solution Manual C++ Program Design (3rd Ed., Cohoon & Davidson)
Solution Manual Java : Program Design 5.0 (Cohoon & Davidson)

Solution Manual Programming in C++ : Lessons and Applications (Timothy B. D'Orazio)
Solution Manual Applied C : An Introduction and More (Alice Fischer)
Solution Manual Programming Languages : Principles and Paradigms (1st Ed., Allen Tucker & Robert Noonan)
Solution Manual Programming Languages : Principles and Paradigms (2nd Ed., Allen Tucker & Robert Noonan)
Solution Manual Introduction to Parallel Computing (2nd Ed., Grama, Karypis, Kumar & Gupta)
Solution Manual Parallel Programming in C with MPI and Open MP (Michael J Quinn)
Solution Manual Data Communications and Network Security (Houston H. Carr & Charles Snyder)
Solution Manual Data Communications and Networks (David Miller)
Solution Manual Management Information Systems (3rd Ed., Post & Anderson)
Solution Manual Management Information Systems (4th Ed., Post & Anderson)
Solution Manual Database Management Systems (3rd Ed. Post)
Solution Manual Management Information Systems (9th Ed., James A. O'Brien, George Marakas)
Solution Manual Introduction to Systems Analysis and Design (Whitten & Bentley)
Solution Manual Systems Analysis & Design : An Active Approach (2nd Ed., Marakas)
Solution Manual An Introduction to Object-Oriented Programming with Java (4th Ed., C. Thomas Wu - Otani)
Solution Manual An Introduction to Object-Oriented Programming with Java (5th Ed., C. Thomas Wu - Otani)
Solution Manual A Comprehensive Introduction to Object-Oriented Programming With Java (C. Thomas Wu)
Solution Manual Data Structures and the Java Collections Framework (1st Ed., William Collins)
Solution Manual Data Structures and the Java Collections Framework (2nd Ed., William Collins)
Solution Manual Data Structures and the Standard Template Library (William Collins)
Solution Manual Database System Concepts (4th Ed., Silberschatz)
Solution Manual Database System Concepts (5th Ed., Silberschatz)
Solution Manual Database System Concepts (6th Ed., Silberschatz, Korth & Sudarshan)
Solution Manual Database Management Systems (3rd Ed., Ramakrishnan & Gehrke)
Solution Manual Fundamentals of Network Security (Eric Maiwald)
Solution Manual Computing Concepts (1st Ed., Haag, et al.)
Solution Manual Computing Concepts (2nd Ed., Haag et al.)
Solution Manual Microsoft Office 2003 (Haag et al.)
Solution Manual Advanced Programming Using Visual Basic .NET (2nd Ed., Julia Case Bradley & Anita Millspaugh)
Solution Manual Advanced Programming Using Visual Basic 2005 (3rd Ed., Julia Case Bradley & Anita Millspaugh)
Solution Manual Programming with Java (Julia Case Bradley & Anita Millspaugh)

Solution Manual Programming in C#.Net (1st Ed., Julia Case Bradley & Anita Millspaugh)
Solution Manual Programming in Visual C# 2005 (2nd Ed., Julia Case Bradley & Anita Millspaugh)
Solution Manual Learning Programming Using Visual Basic.Net (Bill Burrows & Joe Lanford)
Solution Manual Programming in Visual Basic.NET : Visual Basic.NET 2005 (6th Ed., Julia Case Bradley & Anita Millspaugh)
Solution Manual Programming in Visual Basic .Net : 2003 Update Edition (5th Ed., Julia Case Bradley & Anita Millspaugh)
Solution Manual Survey of Operating Systems (2nd Ed., Jane Holcombe & Charles Holcombe)
Solution Manual Principles of Voice and Data Communications (Regis J. Bates & Marcus Bates)
Solution Manual Mike Meyers' Network+ Guide To Managing and Troubleshooting Networks (Michael Meyers)
Solution Manual Introduction to Windows Server 2003 (Eric Ecklund)
Solution Manual Programming The Web : An Introduction (Barrie Sosinsky & Valda Hilley)
Solution Manual Programming The Web Using XML (Ellen Pearlman & Eileen Mullin)
Solution Manual Internet Marketing : Building Advantage in a Networked Economy (2nd Ed., Rafi Mohammed et al.)
Solution Manual Internet Technologies at Work (Fred T. Hofstetter)
Solution Manual Internet Literacy (4th Ed., Fred T. Hofstetter)
Solution Manual Software Engineering : A Practitioner's Approach (5th Ed., Roger Pressman)
Solution Manual Software Engineering : A Practitioner's Approach (6th Ed., Roger Pressman)
Solution Manual Software Engineering : A Practitioner's Approach (7th Ed., Roger Pressman)
Solution Manual Web Engineering : A Practioner's Approach (1st Ed., Roger S. Pressman & David Lowe)
Solution Manual Object-Oriented Software Engineering (Stephen Schach)
Solution Manual Object-Oriented and Classical Software Engineering (5th Ed., Steve Schach)
Solution Manual Object-Oriented and Classical Software Engineering (6th Ed., Steve Schach)
Solution Manual Object-Oriented and Classical Software Engineering (7th Ed., Steve Schach)
Solution Manual Object-Oriented and Classical Software Engineering (8th Ed., Steve Schach)
Solution Manual Introduction to Object-Oriented Analysis and Design (Steve Schach)
Solution Manual Communication Networks (2nd Ed., Alberto Leon-Garcia & Indra Widjaja)
Solution Manual Fundamentals of Digital Logic with Verilog Design (1st Ed., Stephen Brown & Zvonko Vranesic)
Solution Manual Fundamentals of Digital Logic with Verilog Design (2nd Ed., Stephen Brown & Zvonko Vranesic)
Solution Manual Continuous and Discrete Control Systems (John Dorsey)
Solution Manual Engineering Circuit Analysis (6th Ed., William Hayt, Jack Kemmerly & Steven Durbin)

Solution Manual Engineering Circuit Analysis (7th Ed., William Hayt, Jack Kemmerly & Steven Durbin)
Solution Manual Engineering Electromagnetics (7th Ed., William Hayt & John Buck)
Solution Manual Principles of Electronic Materials and Devices (2nd Ed., Safa O. Kasap)
Solution Manual Principles of Electronic Materials and Devices (3rd Ed., Safa O. Kasap)
Solution Manual Programming in Haskell (Graham Hutton)
Solution Manual Probability and Random Processes With Applications to Signal Processing and Communications (Miller & Childers)
Solution Manual Logic in Computer Science : Modelling and Reasoning about Systems (2nd Ed., Michael Huth & Mark Ryan)
Solution Manual Introduction to Distributed Algorithms (2nd., Gerard Tel)
Solution Manual Information Theory, Inference and Learning Algorithms (David J. C. MacKay)
Solution Manual Digital Systems Engineering (William Dally & John Poulton)
Solution Manual Concepts in Programming Languages (by John Mitchell)
Solution Manual Simulation Modeling and Analysis (3rd Ed., Averill Law & David Kealton)
Solution Manual Simulation Modeling and Analysis with Expertfit Software (4th Ed., Averill Law)
Solution Manual System Modeling and Analysis : Foundations of System Performance Evaluation (Hisashi Kobayashi & Brian Mark)
Solution Manual Wireless Communications (Andrea Goldsmith)
Solution Manual Testing of Digital Systems (N. K. Jha & S. Gupta)
Solution Manual Space-Time Coding (Hamid Jafarkhani)
Solution Manual Space-Time Block Coding for Wireless Communications (Erik Larsson & Petre Stoica)
Solution Manual Smart Electronic Materials : Fundamentals and Applications (Jasprit Singh)
Solution Manual Radio-Frequency Electronics : Circuits and Applications (Jon Hagen)
Solution Manual Photonic Devices (Jia-ming Liu)
Solution Manual Networking Wireless Sensors (Bhaskar Krishnamachari)
Solution Manual Mobile Wireless Communications (Mischa Schwartz)
Solution Manual Introduction to Color Imaging Science (Hsien-Che Lee)
Solution Manual Fundamentals of Wireless Communication (David Tse & Pramod Viswanath)
Solution Manual Fundamentals of Modern VLSI Devices (Yuan Taur & Tak H. Ning)
Solution Manual Electronic and Optoelectronic Properties of Semiconductor Structures (Jasprit Singh)
Solution Manual An Introduction to Statistical Signal Processing (Robert M. Gray)
Solution Manual An Introduction to Radio Frequency Engineering (Christopher Coleman)
Solution Manual Algebraic Codes for Data Transmission (Richard Blahut)
Solution Manual Fundamentals of Solid State Electronics (C.T. Sah)
Solution Manual Fundamentals of Solid State Engineering (2nd Ed., Manijeh Razeghi)

Solution Manual Robot Modeling and Control (Spong, Hutchinson & Vidyasagar)
Solution Manual Theory of Applied Robotics : Kinematics, Dynamics and Control (Reza N. Jazar)
Solution Manual Control of Robot Manipulators in Joint Space (R. Kelly, V. Santib=E1=F1ez, A. Lor=EDa)
Solution Manual Modelling and Control of Robot Manipulators (2nd Ed., Lorenzo Sciavicco, Bruno Siciliano)
